## ABSTRACT

Resource seeking, or the act of asking others for things that can help one attain one's goals, is an important behavior within organizations due to the increasingly dynamic nature of work that demands collaboration and coordination among employees. Over the past two decades, there has been growing research in the organizational sciences on four types of resource seeking behaviors: feedback-, information-, advice-, and help-seeking. However, research on these four behaviors has existed in separate silos. We argue that there is value in recognizing that these behaviors reflect a common higher order construct (resource seeking), and in integrating the findings across the four literatures as a basis for understanding what we do and do not know about the predictors and outcomes of resource seeking at work. More specifically, we use conservation of resources (COR) theory as a framework to guide our integration across the four literatures and to both deepen and extend current understandings of why and when employees engage in resource seeking as well as how resource seeking behaviors may lead to both individual- and collective-level outcomes. We conclude with a discussion of future research needs and how COR theory can provide a fruitful foundation for future resource seeking research.

**Keywords:** feedback seeking; information seeking; advice seeking; help seeking; conservation of resources theory

## SOLICITING RESOURCES FROM OTHERS: AN INTEGRATIVE REVIEW

Employees often need resources from others to be effective and successful in their jobs. As these resources are in many cases not voluntarily provided, employees may need to proactively seek them from coworkers, supervisors, or other individuals. This may take the form of feedback seeking, where they ask others about how well they are performing or how they might improve. It may take the form of information seeking, where employees solicit information to better understand their work environment or to perform particular aspects of their work. It may take the form of advice seeking, where employees solicit the judgment of others before making a decision. Or it may take the form of help seeking, where employees ask others to assist or to contribute effort toward accomplishing a task.

These four types of resource seeking: feedback-, information-, advice-, help-seeking, have been studied in four distinct literatures. One might argue that these silos are appropriate, as the four behaviors have different definitions and operationalizations. Moreover, the four behaviors have different historical origins and theoretical roots, are elicited by different types of context, and have different foci and goals. However, a closer examination of the empirical literature suggests that there are important commonalities, and that by studying the four behaviors as separate constructs, we are “missing the forest for the trees”. We see the conceptual and empirical commonalities as suggesting an important opportunity to integrate and transfer key insights across the four bodies of work.

In other words, we argue that the similarities among the four behaviors justify viewing them as forms of a higher order construct, *resource seeking*, and also suggest value in an integrative review with an emphasis on common and complementary findings. Our review aims to provide more clarity regarding theoretical and conceptual convergence, and overlapping

1  
2  
3 nomological networks, among these four behaviors. More specifically, the objective of this paper  
4  
5 is to review the research on the antecedents and outcomes of the four primary resource-seeking  
6  
7 behaviors that have been examined by organizational researchers (feedback seeking, information  
8  
9 seeking, advice seeking, and help seeking). We do so by using conservation of resources (COR)  
10  
11 theory (Hobfoll, 1988; 1989) as an overarching framework, with the aim of providing conceptual  
12  
13 integration, a fresh and more nuanced perspective on the literature, and a more theory-grounded  
14  
15 agenda for future research.  
16  
17  
18

19         Accordingly, our review contributes to the literature in two key ways. First, it highlights  
20  
21 that the four resource seeking behaviors share important similarities even though they have  
22  
23 emerged and developed in distinct literatures. Our systematic review of antecedents and  
24  
25 outcomes points to nomological overlaps of these resource seeking behaviors, suggests areas  
26  
27 where critical insights can be transferred from one literature to another, and thus broadens our  
28  
29 understanding of the predictors and outcomes of resource seeking behavior. Second, our review  
30  
31 leverages COR theory as a basis for framing and synthesizing insights from the four literatures.  
32  
33 COR theory proposes that people are motivated to protect and conserve their current resources as  
34  
35 well as to acquire new resources (Halbesleben, Neveu, Paustian-Underdahl, & Westman, 2014;  
36  
37 Hobfoll, 1988; Hobfoll, Halbesleben, Neveu, & Westman, 2018). By utilizing COR theory's  
38  
39 primary principles, we are able to integrate empirical findings across the different bodies of  
40  
41 literature in a parsimonious way to explain why people seek resources and how resource seeking  
42  
43 influences important work outcomes. Anchoring our review in COR theory also allows us to  
44  
45 extend the literature by moving beyond the relatively static, between-person perspective of  
46  
47 resource seeking found in most of the literature and bringing to light the dynamic within-person  
48  
49 nature of this behavior.

1  
2  
3 Our review is organized as follows. We begin by clarifying the conceptualizations of  
4 resources and resource seeking, and briefly discuss the origins and conceptual foundations of  
5 research on each of the four seeking behaviors that are included in our review. In doing so, we  
6 highlight both key similarities between and differences. In the second section, we outline COR  
7 theory's central principles of resource conservation, investment, and acquisition (Halbesleben et  
8 al., 2014; Hobfoll, 1988; Hobfoll et al., 2018) and explain how they can be used to both guide  
9 and extend current understanding of why and when employees engage in resource seeking. In the  
10 third and fourth sections, we provide an integrative review of the antecedents that influence  
11 resource seeking and the moderators that condition these effects. Next, we review the empirical  
12 research on the positive and negative outcomes of resource seeking behavior. In the final section,  
13 we discuss directions for future research, with an emphasis on how COR theory can provide a  
14 fruitful foundation for dynamic within-person research on resource seeking. In addition, using  
15 the lens of COR theory, we will highlight key areas that have been under-researched, as well as  
16 suggest future studies aiming to reconcile inconsistent findings in the empirical literature.

### 35 **RESOURCE SEEKING: ORIGINS AND CONCEPTUAL FOUNDATIONS**

36  
37 Resources can be defined as anything perceived by individuals as helping them to attain  
38 their goals (Halbesleben et al., 2014). It is important to note that a resource in and of itself is not  
39 inherently valued, but rather, its value is derived from the outcomes it helps to achieve (Ashford  
40 & Cummings, 1983). For example, information about why a presentation went badly can help  
41 one to avoid repeating the mistake, or help from a colleague can enable one to meet an important  
42 task deadline. In the workplace, common resources for employees include information,  
43 assistance, support, tools, equipment, funding, and so forth. Employee *resource seeking* can be  
44 defined as the act of asking others in the workplace for one or more of these resources in the  
45

1  
2  
3 course of doing one's job. Employees seek resources not only to complete specific tasks or attain  
4  
5 specific work-related goals, but more broadly, to manage their effectiveness at work as well as  
6  
7 various work-related opportunities and challenges. Employees may solicit a multitude of  
8  
9 resources at work, including information to better understand their work environment or how to  
10  
11 succeed within it, feedback about what they are doing well and not so well, advice about how to  
12  
13 resolve an interpersonal conflict at work or about how to achieve an optimal balance between  
14  
15 work and family, or help from a peer in order to meet an impending task deadline.  
16  
17  
18

19         Below, we briefly discuss the emergence and development of the empirical research on  
20  
21 each of the four behaviors (feedback, information, advice, and help seeking). In doing so, our  
22  
23 goal is to highlight the similarities among these constructs, which enables us to generalize the  
24  
25 empirical findings from one form of resource seeking behavior to the other forms. However, we  
26  
27 do not overlook some of the ways in which the four types of resource seeking differ from one  
28  
29 another. Table 1 summarizes the conceptual comparisons among the four types of resource  
30  
31 seeking, highlighting both the similarities and differences across the four literatures.  
32  
33  
34

35         One of the most robust literatures on resource seeking is the research on feedback seeking  
36  
37 behavior. This research is rooted in the seminal paper by Ashford and Cummings (1983) that  
38  
39 proposed that feedback about one's performance is an important *personal* resource for fulfilling  
40  
41 both performance and non-performance goals, and thus something that employees may  
42  
43 proactively seek. This was a rather radical perspective at the time, as prior to this paper, feedback  
44  
45 was viewed mainly as an *organizational* resource that managers could use to direct or motivate  
46  
47 the performance of their subordinates. Based on Ashford and Cummings' (1983)  
48  
49 conceptualization, feedback seeking was defined as "the conscious devotion of effort toward  
50  
51 determining the correctness and adequacy of behavior for attaining valued end states" (Ashford,  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 1986, p. 466). Consistent with earlier models of information seeking within the communication  
4 literature (e.g., Berger & Calabrese, 1975), Ashford and Cummings (1983) conceptualized  
5 feedback seeking as a process of uncertainty reduction, with the individual deciding whether to  
6 seek feedback based on the anticipated costs and benefits. Their paper highlights several motives  
7 for feedback seeking, including self-evaluation and the quest for mastery. Over the past three  
8 decades, a sizable body of empirical research has examined the antecedents and outcomes of  
9 feedback seeking, as summarized in a number of reviews (Anseel, Beatty, Shen, Lievens, &  
10 Sackett, 2015; Ashford, Blatt, & VandeWalle, 2003; Ashford, De Stobbeleir, & Nujella, 2016).

11  
12  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22 A related body of research has looked at information seeking more broadly (Bauer &  
23 Green, 1998; Morrison, 1993a, 1993b, 2002). Information seeking refers to the act of seeking  
24 information about one's job or work context to cope with uncertainty and engage in sense-  
25 making (Miller & Jablin, 1991; Saks & Ashforth, 1997). The majority of this work has focused  
26 on information seeking behaviors in the context of newcomer socialization, and how seeking  
27 information about the job and organization improves newcomer adjustment and socialization  
28 outcomes (Morrison, 1993a). Similar to research on feedback seeking, this literature largely  
29 utilizes a cost-benefit analysis framework and is rooted in notions of uncertainty reduction  
30 (Morrison & Vancouver, 2000; Vancouver & Morrison, 1995).

31  
32  
33  
34  
35  
36  
37  
38  
39  
40  
41  
42 Advice seeking is defined as deliberate information exchange with other individuals as  
43 part of the process of forming opinions, attitudes, and judgments (Bonaccio & Dalal, 2006).  
44 Unlike research on feedback and information seeking, advice seeking has been mostly studied in  
45 the strategic management literature (e.g., Alexiev, Jansen, Van den Bosch, & Volberda, 2010;  
46 Cross, Borgatti, & Parker, 2001; McDonald & Westphal, 2003). The bulk of these studies  
47 focuses on whether and how CEOs and top management teams seek input from different targets  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 prior to making important strategic decisions, and the firm-level outcomes emergent from  
4  
5 soliciting advice. In this literature, there is less emphasis on uncertainty reduction or weighing of  
6  
7 costs and benefits, and more emphasis on the strategic nature of advice seeking based on one's  
8  
9 network and the value of advice that is solicited. To date, the literature on advice seeking has  
10  
11 neither been reviewed nor integrated with work on other forms of resource seeking behavior.  
12  
13

14  
15 Help-seeking refers to the solicitation of emotional or instrumental assistance from others  
16  
17 to manage either work-related or personal problems that have bearing on one's job performance  
18  
19 (Bamberger, 2009). Because it is not strictly focused on informational resources, help-seeking  
20  
21 may appear to be different from the other three types of resource seeking behaviors. However, by  
22  
23 recognizing both informational and *non*-informational forms of assistance as critical resources  
24  
25 for employees, we argue that it is possible to apply insights across literatures in a way that will  
26  
27 provide a broader and integrated understanding. Similar to the feedback and information seeking  
28  
29 literatures, much of the literature on help seeking is grounded in a utility perspective, pitting the  
30  
31 instrumental benefits from resources acquired against the social and psychological costs of  
32  
33 securing them (Bamberger, 2009; Nadler, 1997). Implicit in the help seeking literature is also the  
34  
35 notion of reciprocity, whereby the help seeker is motivated to reciprocate by providing help to  
36  
37 the person who provided assistance (Gouldner, 1960; Spitzmuller, Van Dyne, & Ilies, 2008).  
38  
39  
40  
41

42  
43 As shown in Table 1, the four forms of resource seeking differ from one another in some  
44  
45 important ways. For example, they are elicited by different types of contexts (e.g., uncertainty  
46  
47 for information seeking, a pending decision for advice seeking, or a problem for help seeking).  
48  
49 Furthermore, the foci and goals of the four seeking behaviors differ. Specifically, feedback  
50  
51 seeking focuses mainly on performance, information seeking focuses on information about one's  
52  
53 job or work context more broadly, advice seeking focuses on an impending decision or choice,  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 and help seeking focuses on a work-related or personal problem. Moreover, whereas research on  
4 feedback, information, and help seeking are explicitly rooted in uncertainty reduction and cost-  
5 benefit theories, this theoretical foundation is more implicit in the advice seeking literature. In  
6  
7  
8  
9  
10 addition, only advice seeking has an explicit prescriptive aspect to it, and only help seeking  
11  
12 evokes an expectation of reciprocity. These behaviors also differ in their temporal focus, with  
13  
14 advice and help seeking being more future-oriented (prospective) and feedback seeking being  
15  
16 more past-oriented (retrospective).  
17  
18

19           Despite these differences, the four behaviors also share a number of significant common  
20  
21 attributes. All four behaviors are self-initiated, proactive behaviors that employee engage in to  
22  
23 gain tangible and intangible resources from others that can help them achieve a desired goal  
24  
25 (Grant & Ashford, 2008). Furthermore, a central ingredient across all four seeking behaviors is  
26  
27 that they require an investment of personal resources in order to secure other valued resources.  
28  
29 For example, each of the four behaviors requires an investment of time and energy, and each  
30  
31 may have social costs associated with them, such as highlighting one's uncertainty or need for  
32  
33 assistance. Furthermore as we will show, each of the four behaviors depends on the employee's  
34  
35 current resource state and history of resource gains and losses. There is also some measurement  
36  
37 convergence. For instance, researchers have sometimes borrowed and modified measures of  
38  
39 feedback seeking to assess information seeking and vice versa. Given these common core  
40  
41 elements, we propose that empirical insights gleaned from one literature may be useful for  
42  
43 broadening and deepening the other three, and that there is value in conceptual integration by  
44  
45 considering the four behaviors as manifestations of a higher order construct: resource seeking.  
46

## BRINGING COR TO THE FORE

Originally conceived as a theory of stress, COR theory has become recognized as a framework that can explain motivation and behavior more broadly. Inspired by its emergence as a primary theory for understanding motivation and behavior in the workplace, we use COR theory as an overarching theoretical and organizing framework to guide our integration of the four resource-seeking literatures. We chose COR theory, rather than other frameworks found in the four literatures (e.g., uncertainty reduction, cost-benefit analysis), for three reasons.

First, neither uncertainty reduction theory nor the cost-benefit framework takes into account the notion of resource investment, a fundamental principle of COR theory. From a cost-benefit framework, the energy and attention that resource seeking requires of the seeker are strictly resource losses, likened to sunk costs. In contrast, from the perspective of COR theory, these same resources can be viewed as investments that the seeker uses to acquire other resources (e.g., knowledge). Second, COR theory highlights the less conscious and less rational aspects of the decision to seek resources, going beyond the idea of a rational, calculative assessment of costs and benefits. A COR lens brings to light the heuristic nature of the decision. Specifically, people's current resource status may bias how they subjectively weigh potential gains and losses, and how they seek to maintain an optimal balance between resource conservation and acquisition, which affects whether and how they engage in resource seeking. In contrast, uncertainty reduction and cost-benefit models have not been explicit about how current resource status can bias how people perceive uncertainty and the costs and benefits of seeking resources and ultimately, the decision to seek resources. Third, as a dynamic theory, the application of COR to resource seeking opens up opportunities for areas of research that have hitherto been less examined. In particular, COR theory provides more nuanced theoretical

1  
2  
3 insights into the temporal patterns of resource seeking, by (for example) elucidating how  
4 resource gains and losses may spiral across multiple resource seeking episodes. In so doing,  
5  
6 COR theory highlights the dynamic and path-dependent nature of the resource seeking process.  
7  
8 COR theory also helps to parsimoniously explain why resource seeking results in beneficial or  
9  
10 detrimental outcomes, via both tangible and/or intangible resource gains or losses, and how these  
11  
12 outcomes can influence future resource seeking via the generation of feedback loops.  
13  
14  
15

16  
17 The fundamental tenet of COR theory is that people “strive to obtain, retain, foster, and  
18  
19 protect those things that they centrally value,” or more specifically, they seek to acquire and  
20  
21 conserve resources (Hobfoll et al., 2018). From this primary tenet emerge four central principles  
22  
23 of COR theory. The first is the primacy of loss principle, which states that resource loss is  
24  
25 disproportionately more salient than resource gain. The second is the resource investment  
26  
27 principle, or the idea that people must invest resources in order to gain resources as well as to  
28  
29 protect themselves against and recover from resource loss. The third is the gain paradox  
30  
31 principle, which states that resource gains become more salient and are weighted more when  
32  
33 people have experienced recent resource loss. Fourth, the desperation principle proposes that  
34  
35 resource deprivation drives people to become defensive, aggressive, and even irrational when  
36  
37 their resources are overstretched or exhausted. A corollary of this principle is that primary  
38  
39 resource loss can generate secondary resource loss, and even a spiral of increasing resource  
40  
41 depletion as individuals adopt maladaptive strategies of resource conservation and recovery.  
42  
43  
44  
45

46  
47 These central principles imply that people are motivated to balance resource acquisition  
48  
49 against resource conservation when engaging in resource seeking, and that this process is a  
50  
51 function of current resource status as well as prior gains and losses. In other words, it is not  
52  
53 simply a matter of a rational utility calculus as implied in the current literature. Prior to investing  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 efforts to acquire a particular resource, people's current resource status (i.e., whether one is  
4 resource constrained or depleted) influences whether they are more motivated to conserve their  
5 current resources (e.g., time, energy, image, status), or conversely, more motivated to invest  
6 existing resources to acquire new resources.  
7  
8  
9  
10

11  
12 Applying the key principles of COR theory to the context of resource seeking brings to  
13 light three primary features of this behavior (see Table 2). First, the primacy of loss and resource  
14 investment principles suggest that people consider not just the potential magnitude of the gains  
15 and losses from resource seeking, but also the likelihood (i.e., expectancy) of those gains and  
16 losses occurring. In other words, before seeking resources, people evaluate the probability of  
17 accruing the anticipated benefits (e.g., obtaining actionable feedback on one's performance)  
18 and/or incurring the potential costs (e.g., appearing insecure). COR theory suggests that people  
19 are more likely to seek resources when both the perceived magnitude and likelihood of potential  
20 gains (e.g., enhanced task performance, skill acquisition) from doing so exceed the perceived  
21 magnitude and likelihood of anticipated resource investment or cost (e.g., effort expenditure,  
22 being viewed negatively by others).  
23  
24

38 Second, the gain paradox and desperation principles imply that subjectivity and  
39 heuristic considerations play an important role in the process of seeking resources. As suggested  
40 by these principles, people's current resource state, especially after they have experienced  
41 resource loss, affects how they subjectively weigh conservation and acquisition. Thus, two  
42 individuals with different resource inventories, or where one has experienced recent resource  
43 loss and the other has not, are likely to place different weights on the potential gains and losses  
44 of resource seeking, and hence different emphasis on resource acquisition versus conservation.  
45 Specifically, the gain paradox principle suggests that the individual whose current resource status  
46

2  
3 is relatively lower, or who has suffered recent resource loss, is likely to place greater weight on  
4 potential gains than losses, and thus be more motivated to acquire resources than conserve them.  
5  
6

7  
8 Third, the desperation principle and its corollary imply that resource seeking is a  
9 dynamic process. Initial resource loss or depletion can result in secondary resource loss, which  
10 may be sustained due to inefficient and maladaptive responses to the initial resource loss. The  
11 primary and secondary resource losses may potentially spiral into a cycle of increasing resource  
12 deprivation from which the resource seeker may find it increasingly difficult to recover, thus  
13 aggravating future resource seeking behavior (a negative spiral) and adversely affecting  
14 performance.

### 29 **Scope of This Review**

30  
31 Our review focuses primarily on empirical articles published between 1997 and 2019,  
32 although we do discuss some foundational conceptual and empirical articles published in the  
33 prior two decades. More specifically, we review classes of antecedents, outcomes, and  
34 moderators which have been examined across the four literatures. We gathered the articles for  
35 the review through Google Scholar and an elaborate search of the EBSCO host database, which  
36 covers the main domains for our review. We provide a detailed description of the search process,  
37 and the journals covered in our review, in the Appendix.

### 48 **ANTECEDENTS OF RESOURCE SEEKING**

49  
50 Using COR theory as our overarching theoretical framework, we organize the  
51 antecedents of resource seeking according to the relative strength of the resource conservation  
52 and acquisition motives. First, we review antecedents which are likely to operate by increasing  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 the relative salience and subjective weight of the resource conservation motive over the resource  
4 acquisition motive, and thus are largely negatively associated with resource seeking. Next, we  
5 review classes of antecedents which are likely to operate by increasing the relative salience and  
6 subjective weight of resource acquisition over resource conservation, and thus are for the most  
7 part positively associated with resource seeking. Our review of both sets of antecedents is  
8 organized by levels of analysis: seeker characteristics, characteristics of the target and/or dyadic  
9 relationships, and work and external environmental characteristics. We focus on antecedents that  
10 have been most widely studied, across the four literatures, and with the strongest and most  
11 consistent evidence base. In so doing, our review reveals that most of these antecedents have  
12 been examined in two or more of the literatures, suggesting overlapping nomological network  
13 and hence value in integrating these literatures. Table 3 provides a summary of the classes of  
14 antecedents, indicating whether they have been examined in all four literatures or just a sub-set.

### 36 **Antecedents that Strengthen the Resource Conservation Motive**

37  
38 *Characteristics of the seeker: Demographics and ego concerns.* Empirical research  
39 suggests that the seeker's demographics may affect the likelihood of resource seeking.  
40 Specifically, factors such as gender, age, and tenure have implications for how one is viewed by  
41 others (Berger, Rosenholtz, & Zelditch, 1980; Bunderson, 2003; Stamper & Van Dyne, 2001).  
42 When these attributes imply higher knowledge or competence, individuals may be concerned  
43 that the solicitation of resources may diminish others' impressions of them, prompting seekers to  
44 place more weight on the potential costs of resource seeking and hence more value on resource  
45 conservation than resource acquisition.

56  
57  
58  
59  
60

1  
2  
3           Among these demographic characteristics, gender has been the most widely studied  
4 antecedent of resource seeking across all four literatures. Past research finds that men are  
5 generally expected to be more competent than women (Fiske, 1998; Fiske, Cuddy, Glick, & Xu,  
6 2002; Ridgeway, 1997), suggesting that they place less value in resource seeking. Lee (2002)  
7 theorizes that whereas females are socialized to be other-oriented, build close relationships, and  
8 reduce interpersonal distances created by power, men are socialized to be power-oriented and  
9 reduce dependencies on others so that they can exercise power. Therefore, the social costs of  
10 resource seeking are likely higher for men, suggesting that men will place more weight on  
11 resource conservation over resource acquisition as compared to women, and as a result, are less  
12 likely to seek resources. Consistent with this logic, men report lower levels of feedback seeking  
13 (Wu, Parker, & De Jong, 2014), information seeking (Janssen & Prins, 2007), advice seeking  
14 (Kuhn, Galloway, & Collins-Williams, 2016), and help seeking (Bornstein, 1998; Lee, 1997,  
15 2002) than women.

16  
17           In a similar vein, employees who are older or more experienced are expected to have  
18 greater work knowledge, and may thus place heavy emphasis on protecting their “image of  
19 competence.” This will prompt them to conserve resources rather than investing them in  
20 resource seeking, as the latter can signal a lack of competence. Supporting this idea, studies find  
21 that seeker age is negatively associated with feedback seeking (Anseel et al., 2015;  
22 Vandenberghe & Panaccio; 2012; van der Rijt, van de Wiel, Van den Bossche, Segers, &  
23 Giljselaers, 2012; Wu et al., 2014), information seeking (De Vos & Freese, 2011; Finkelstein,  
24 Kulas, & Dages, 2003; Janssen & Prins, 2007), and advice seeking (Kuhn et al., 2016).  
25 Similarly, feedback seeking (Anseel et al., 2015; Ashford, 1986), information seeking (Janssen  
26 & Prins, 2007; Vandenberghe & Panaccio, 2012; Wu et al., 2014), advice seeking (McDonald,  
27

2  
3 Khanna, & Westphal, 2008), and help seeking behaviors (Friedman, Carmeli, & Dutton, 2018)  
4  
5 have been shown to decrease with organizational or job tenure.  
6

7  
8 Empirical evidence also suggests that ego or self-concept concerns are a key seeker-level  
9  
10 determinant of resource seeking. Building on the primacy of loss principle of COR theory,  
11  
12 resource loss is likely to be disproportionately more salient than resource gain for individuals  
13  
14 with greater concerns about the self. For such individuals, potentially losing “face” and being  
15  
16 perceived as weak by others may be weighted more heavily than gaining knowledge and skills,  
17  
18 which will result in lower likelihood of seeking resources. Indeed, people who fear negative  
19  
20 evaluation or desire to protect their ego/image have been shown to seek less feedback (Lu, Pan,  
21  
22 & Cheng, 2011; Northcraft & Ashford, 1990; Qian, Lin, & Chen, 2012), information (Tuckey,  
23  
24 Brewer, & Williamson, 2002), advice (Brooks, Gino, & Schweitzer, 2015), and help (Lee, 2002).  
25  
26  
27

28 ***Characteristics of the relationship: Conflict.*** The nature of the dyadic relationship  
29  
30 between the seeker and target also plays an important role in affecting resource seeking. In  
31  
32 particular, when relational dynamics are unhealthy, there is a greater risk of the target declining a  
33  
34 seeker’s request for resources, thus increasing the costs of resource seeking, and hence inducing  
35  
36 a greater emphasis on conserving resources than investing and acquiring resources. One such  
37  
38 factor that constitutes negative relational dynamics is conflict. In a study involving newcomers,  
39  
40 Nifadkar and Bauer (2016) demonstrate that relationship conflict, task conflict, and process  
41  
42 conflict, are all negatively related to information seeking from coworkers, effects that are  
43  
44 mediated by social anxiety. These findings suggest that conflict, and the social anxiety it evokes,  
45  
46 can deplete resources and heighten seekers’ sensitivity toward losses and strengthen the resource  
47  
48 conservation motive, thereby reducing the likelihood of resource seeking. COR theory’s  
49  
50 desperation principle also suggests that conflict may place employees in a position of actual or  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 potential resource loss and prompt them to become more defensive in an effort to preserve their  
4 existing resources. Instead of placing greater emphasis on resource gains and engaging in  
5 resource seeking to protect themselves from further resource loss, employees who are  
6 experiencing conflict may scale back on resource investment and conserve their resources,  
7 thereby reducing their engagement in resource seeking. Interestingly, however, a recent study  
8 reports that while relationship conflict is negatively associated with advice seeking, task conflict  
9 may have a positive association with it (Marineau, Hood, & Labianca, 2018). Results from that  
10 study also show that when individuals perceive both task and relationship conflict in the same  
11 relationship, they are more likely to seek advice from that person, suggesting that despite the  
12 potential for resource loss associated with relationship conflict, the instrumental benefits of  
13 obtaining advice from someone who has different ideas on how to perform a given task (i.e., task  
14 conflict) may be weighted more heavily.

23  
24  
25  
26  
27  
28  
29  
30  
31 ***Characteristics of the external environment: National culture.*** Research has also  
32 examined how external environmental characteristics may inhibit resource seeking, and in  
33 particular, the impact of national culture. Scholars suggest that a high power distance culture  
34 may increase the perceived social costs associated with requesting resources from targets with  
35 higher power or status (Hofstede, 2001; Liao & Bond, 2011). Consistent with this notion, several  
36 studies indicate that in high power distance cultures, employees are less likely to seek feedback  
37 (Morrison, Chen, & Salgado, 2004; Taras, Kirkman, & Steel, 2010). Cultures characterized by  
38 collectivistic values may also exhibit less resource seeking. Specifically, Morrison and  
39 colleagues (2004) find that Hong Kong Chinese employees report lower levels of feedback  
40 seeking behavior than American employees. Collectivistic cultures dampen employees'  
41 assertiveness, which may prompt them to be less confident, and thus place greater weight on the  
42

1  
2  
3 potential costs of resource seeking (Morrison et al., 2004). Another study finds that relative to  
4 European Americans, Asians report less emotional help seeking in the face of stress (Taylor et  
5 al., 2004), implying that perceived social costs in the form of losing “face” and burdening others  
6 are higher in East Asian cultures than in Western cultures, which may discourage actively  
7 engaging one’s social support network for help.  
8  
9  
10  
11  
12  
13

14 **Summary.** Across the four resource seeking literatures, the empirical evidence shows that  
15 employees who are male, older, with longer tenure, and with stronger ego concerns are less  
16 likely to engage in resource seeking. The literature also suggests that conflict decreases resource  
17 seeking behavior, as do the cultural dimensions of power distance and collectivism. Each of  
18 these antecedents is likely to decrease resource seeking by heightening seeker’s sensitivity  
19 toward losses to their status and/or image, thereby prompting seekers to place more weight on  
20 resource conservation than resource acquisition. Furthermore, COR theory suggests that conflict  
21 may potentially deplete people’s resources and place them in a state of resource constraint,  
22 which then induces them to become defensive and conserve their resources, instead of using  
23 them to acquire other resources as a means by which to stem resource depletion.

### 38 **Antecedents that Strengthen the Resource Acquisition Motive**

39  
40 In this section, we review antecedents that are likely to increase the relative salience and  
41 subjective weight of the resource acquisition motive over the resource conservation motive,  
42 thereby increasing the likelihood of resource seeking. We first discuss seeker characteristics.  
43 This is followed by a summary of research on antecedents related to the target and the seeker-  
44 target relationship, and then a review of the research on contextual antecedents.  
45  
46  
47  
48  
49  
50

51 **Characteristics of the seeker: Promotion focus dispositions.** Building on self-regulatory  
52 theory (Higgins, 1997; 1998), promotion focus dispositions can be viewed as those individual  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 dispositions associated with the desire for attaining positive outcomes (Higgins, Roney, Crowe,  
4 & Hymes, 1994; Shah, Higgins, & Friedman, 1998). There is robust empirical evidence that  
5  
6 various promotion focus dispositions increase the likelihood of resource seeking. We argue that  
7  
8 this occurs because a strong promotion focus increases the relative salience and significance of  
9  
10 resource acquisition over resource conservation.  
11  
12  
13

14  
15 The promotion focus disposition that has received the most attention in the literature is  
16  
17 learning goal orientation (LGO). Individuals with high LGO—those who place a higher weight  
18  
19 on the value of acquiring and mastering new skills and adapting to new situations (Dweck,  
20  
21 1986)—have been shown to be more likely to seek both feedback (Anseel et al., 2015; Gong, Li,  
22  
23 Qi, & Zhang, 2017; Parker & Collins, 2010; Payne, Youngcourt, & Beaubien, 2007; Tan, Au,  
24  
25 Cooper-Thomas, & Aw, 2016; Tuckey et al., 2002; VandeWalle & Cummings, 1997) and  
26  
27 information (Janssen and Prins 2007; Madzar, 2001) than those with low LGO. Empirical  
28  
29 research has also provided direct support for the idea that individuals with high LGO emphasize  
30  
31 acquiring resources over conserving them. Specifically, employees with high LGO have been  
32  
33 shown to place greater weight on feedback, and in turn, seek more feedback (VandeWalle &  
34  
35 Cummings, 1997; VandeWalle, Ganesan, Challagalla, & Brown, 2000). On the whole, research  
36  
37 suggests that employees with high LGO (versus low LGO) are more likely to engage in resource  
38  
39 seeking because they are more sensitive to, and assign greater weight to the benefits of resource  
40  
41 seeking, and to that end, place greater emphasis on resource acquisition.  
42  
43  
44  
45  
46

47  
48 Empirical studies have also investigated the impact of the Big Five personality traits on  
49  
50 resource seeking, and in particular openness to experience, which can also be viewed as a  
51  
52 promotion focus disposition (Lanaj, Chang, & Johnson, 2012). For example, employees who are  
53  
54 more open to experience seek more feedback, likely because they are more open to input from  
55  
56  
57  
58  
59  
60

1  
2  
3 others and can better leverage that input, compared to those who are less open to experience  
4  
5 (Krasman, 2010; Wanberg & Kammeyer-Mueller, 2000). Relatedly, research finds that curious  
6  
7 individuals are more likely to seek feedback (Harrison & Dossinger, 2017) and information  
8  
9 (Harrison, Sluss, and Ashforth, 2011), compared to less curious individuals. Given that curiosity  
10  
11 captures a human “desire for knowledge” (Loewenstein, 1994), the link between curiosity and  
12  
13 resource seeking likely reflects curious individuals perceiving greater value in acquiring  
14  
15 knowledge through resource seeking.  
16  
17  
18

19           Research has also consistently shown a link between extraversion and resource seeking,  
20  
21 another Big Five personality trait reflecting a promotion focus (Lanaj et al., 2012). Employees  
22  
23 with high (versus low) extraversion have been found to be more likely to seek feedback  
24  
25 (Krasman, 2010; Wanberg & Kammeyer-Mueller, 2000), information (Wanberg & Kammeyer-  
26  
27 Mueller, 2000), and help (Von Dras & Siegler, 1997). Underlying this robust relationship may be  
28  
29 that extraverts, being more sociable, assertive, and confident of building positive relationships  
30  
31 (Costa & McCrae, 1988; McCrae & Costa, 1999), have a higher expectancy that they will be  
32  
33 effective in gaining resources from another person. This higher expectancy prompts them to  
34  
35 assign greater weight to resource acquisition than resource conservation, thus increasing their  
36  
37 motive to seek resources.  
38  
39  
40  
41

42           Along with the Big Five, self-esteem and self-efficacy are deemed by most organizational  
43  
44 scholars as core dispositional factors (Judge, Piccolo, & Kosalka, 2009), and high self-  
45  
46 esteem/efficacy can be seen as reflecting a strong promotion focus (Keller, 2006; Lanaj et al.,  
47  
48 2012). Self-esteem and self-efficacy have also received particular attention in COR theory,  
49  
50 where they are viewed as key personal resources that can shift the individual’s orientation from  
51  
52 resource conservation to resource acquisition (Chen, Westman, & Eden, 2009; Kammeyer-  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 Mueller, Simon, & Judge, 2016). Studies have shown that individuals with high self-esteem are  
4 more likely to seek feedback (Bernichon, Cook, & Brown, 2003; Moss, Valenzi, & Taggart,  
5  
6 2003), and that employees with high self-efficacy are more likely to seek both feedback (Anseel  
7  
8 et al., 2015; Dimotakis, Mitchell, & Maurer, 2017), and information (Gruman, Saks, & Zweig,  
9  
10 2006; Kossek, Roberts, Fisher, & Demarr, 1998).<sup>1</sup> Consistent with COR theory's resource  
11  
12 investment principle, individuals with high (versus low) self-esteem are in a better position to  
13  
14 invest resources to generate more resources, and thus may perceive higher utility in the resources  
15  
16 that they hope to acquire and also lower costs. Similarly, individuals with high (versus low) self-  
17  
18 efficacy have a stronger belief in their ability to execute a desired course of action. As a result,  
19  
20 they may place greater weight on resource acquisition than conservation as they may attribute a  
21  
22 higher likelihood that their resource solicitation will yield the desired benefits.  
23  
24  
25  
26  
27

28  
29 Additionally, studies suggest that individuals with a strong dispositional need to gain  
30  
31 control of their environment, another indicator of being promotion focused (Molden & Higgins,  
32  
33 2004), engage in more resource seeking, and in particular, more information seeking (Ashford &  
34  
35 Black, 1996). This is consistent with COR theory's resource investment principle, as individuals  
36  
37 with high need for control are likely to place more value on acquiring resources as a means of  
38  
39 gaining control in the face of uncertainty, and hence invest time and energy toward resource  
40  
41 seeking. Further, individuals with high external feedback propensity—desire for obtaining  
42  
43 feedback from an external source (Herold, Parsons, & Rensvold, 1996)—are more likely to seek  
44  
45 feedback (Anseel et al., 2015; Fedor, Rensvold, & Adams., 1992; Moss et al., 2003; Renn &  
46  
47 Fedor, 2001), as are those with a strong feedback orientation, or overall receptivity to feedback  
48  
49  
50  
51  
52  
53

---

54  
55 <sup>1</sup> While meta-analytic results (Anseel et al., 2015) provide support for the idea that self-efficacy is positively related  
56 to feedback seeking, it is worth noting that Sherf and Morrison (2019) found that the relationship can be either  
57 positive or negative, depending on the extent to which the seeker engages in perspective taking.  
58  
59  
60

1  
2  
3 feedback (Anseel et al., 2015; Dahling, Chau, & O'Malley, 2012). Taken together, these findings  
4  
5 suggest that individuals who are more motivated to gain control, and/or more open to external  
6  
7 input, will weigh resource acquisition more than resource conservation.  
8  
9

10 ***Characteristics of the target: Warmth and competence.*** There is strong consensus in  
11  
12 social perception research that warmth and competence are fundamental dimensions of self and  
13  
14 other evaluation (e.g., Abele & Wojciszke, 2007; Fiske et al., 2002; Judd et al., 2005).  
15  
16 Perceptions of a target's expertise or credibility can be seen as reflecting competence judgments,  
17  
18 whereas perceptions of a target's accessibility and likeability can be seen as reflecting (at least in  
19  
20 part) judgments of warmth. These judgments, in turn, appear to affect the decision to seek  
21  
22 resources from a given target.  
23  
24  
25

26 Perceived expertise of the target has been examined across the four literatures. It has been  
27  
28 shown to positively predict feedback (van der Rijt et al., 2013; Vancouver & Morrison, 1995),  
29  
30 information (Borgatti & Cross, 2003; Morrison & Vancouver, 2000; Mullen & Noe, 1999;  
31  
32 Nebus, 2006), advice (Keith, Demirkan, & Goul, 2017), and help seeking (Hofmann, Lei, &  
33  
34 Grant, 2009; Nadler, Ellis, & Bar, 2003). This is likely due to the perception that a target with  
35  
36 high expertise is very competent and will provide resources of high quality, thereby increasing  
37  
38 the weigh placed on resource acquisition as compared to resource conservation. However, this  
39  
40 effect may reverse when the target has lower status (e.g., a supervisor seeking resources from a  
41  
42 subordinate), as the social costs of resource seeking, such as being perceived negatively by  
43  
44 subordinates, may be more salient and weigh more than the benefits. This may result in  
45  
46 supervisors placing more emphasis on resource conservation than resource acquisition when  
47  
48 considering "downward" resource seeking. Supporting this idea, Chun and colleagues (2018)  
49  
50 find that leaders are less likely to seek feedback from subordinates whom they perceive to have  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 higher (versus lower) expertise. Similarly, research on help seeking suggests that individuals are  
4  
5 hesitant to seek assistance from those with far more (or far less) expertise than they themselves  
6  
7 possess, preferring those closer to them in expertise (Doyle, Lount, Wilk, & Pettit, 2016; Lee,  
8  
9 1997).

10  
11  
12 The perceived credibility of the target also increases the likelihood of resource seeking  
13  
14 behavior. Specifically, Mahajan and Toh (2014) find that expatriates are more likely to seek  
15  
16 advice from coworkers whom they perceive as more credible. Studies have also demonstrated  
17  
18 that employees are more likely to seek feedback and information from targets perceived to be  
19  
20 more credible (Fedor, Rensvold, & Adams, 1992; Sias & Wyers, 2001). Similar to expertise,  
21  
22 perceived target credibility signals that the target is able to provide resources of high quality,  
23  
24 thus increasing the weight of resource acquisition in comparison to resource conservation.  
25  
26

27  
28 In addition, studies have shown that the perceived accessibility of the target increases the  
29  
30 likelihood of resource seeking, as accessibility signals openness to others and implies that  
31  
32 resources can be obtained from the target with relative ease. For example, studies have shown  
33  
34 that people are more likely to seek feedback (van der Rijt et al., 2013; Vancouver & Morrison,  
35  
36 1995), information (Borgatti & Cross, 2003; Morrison & Vancouver, 2000; Nebus, 2006), and  
37  
38 help (Hofmann et al., 2009) when they perceive the target to be more accessible. Conversely,  
39  
40 when a target has rejected the seeker's request for help previously, the seeker is likely to  
41  
42 perceive that the target is less accessible, and hence is less likely to seek help from that person in  
43  
44 the future (Newark, Flynn, & Bohns, 2014).  
45  
46

47  
48 Furthermore, the advice seeking literature suggests that the perceived likeability and  
49  
50 civility of the target, attributes related to warmth, increase the likelihood of seeking advice  
51  
52 (Mahajan & Toh, 2014; Porath, Gerbasi, & Schorch, 2015). Consistent with the notion of  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 attribute substitution (Kahneman, 2011), seekers may use implicit knowledge regarding a  
4  
5 potential target's likeability as a heuristic for driving assumptions about the potential costs of  
6  
7 soliciting resources from that individual, as well as the likelihood that a solicitation attempt will  
8  
9 be successful.  
10

11  
12 Lastly, there is also a sizable body of empirical research which suggests that leadership  
13  
14 styles can influence resource seeking behaviors. Research has largely focused on the influence of  
15  
16 transformational leadership, with studies indicating that people are generally more likely to seek  
17  
18 feedback (Anseel et al., 2015; Levy, Cober, & Miller, 2002), information (Madzar, 2001), and  
19  
20 advice (Bono & Anderson, 2005; Zhang & Peterson, 2011) from transformational rather than  
21  
22 non-transformational leaders. Transformational leadership also appears to have "trickle down"  
23  
24 implications on resource seeking, as Bono and Anderson (2005) find that employees are more  
25  
26 likely to seek advice from peers who have transformational leaders. These findings may be  
27  
28 explained on the basis of higher subjective weight of resource acquisition over resource  
29  
30 conservation. Employees are likely to view transformational leaders as better able to provide  
31  
32 high quality resources given that they are perceived to be more competent and effective than  
33  
34 transactional or non-transformational leaders (Avolio & Yammarino, 1990; Yammarino,  
35  
36 Dubinsky, Comer, & Jolson, 1997). Further, given that transformational leaders tend to pay more  
37  
38 attention to their employees' needs (Bass, 1995), resource seekers may also view these leaders as  
39  
40 being warmer and more accessible, and thus more likely to provide the resources that are  
41  
42 requested.  
43  
44  
45  
46  
47  
48

49 ***Characteristics of the relationship: Commitment.*** Just as negative relational dynamics  
50  
51 (e.g., conflict) can inhibit resource seeking, positive relational dynamics can enable it. A term  
52  
53 that can be used to capture these positive dynamics is relational commitment. Relational  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 commitment refers to the strength and quality of the cognitive and affective attachment between  
4 the seeker and the target (Kanter, 1968; Lawler, 2001). Relational commitment makes it more  
5 likely that a target will agree to a seeker's request for resources, thus increasing the expectancy  
6 that resource seeking will be successful, which increases the weight given to investing and  
7 acquiring resources over conserving them.  
8  
9

10  
11  
12  
13  
14  
15 One signal of relational commitment is the degree to which the relationship is  
16 characterized by reciprocal obligations. From the perspective of social exchange theory (e.g.,  
17 Blau, 1964; Cropanzano & Mitchell, 2005), those who have received resources from someone in  
18 the past feel obliged to reciprocate in the future (Spence, Brown, Keeping, & Lian, 2014). Thus,  
19 a history of resource exchange, and the associated reciprocity obligations, are likely to increase  
20 the expectation that a potential target will agree to a request for resources. Consistent with this  
21 argument, research shows that individuals are more likely to seek advice (Agneessens & Wittek,  
22 2012) and help (Mueller & Kamdar, 2011; Nahum-Shani & Bamberger, 2011) from people to  
23 whom they have previously given advice and help, and that the potential target is more likely to  
24 agree to the request (Porath et al., 2015).  
25  
26  
27  
28  
29  
30  
31  
32  
33  
34  
35  
36

37  
38 A second indicator of relational commitment that has been shown to increase the  
39 likelihood of engaging in resource seeking is perceived similarity between the seeker and the  
40 target, presumably because similarity increases the seeker's expectation that the target will  
41 acquiesce to the request and the resources provided will be relevant and useful. In particular,  
42 studies have shown that individuals are more likely to seek advice from peers who share similar  
43 attributes and job duties (Siciliano, 2015), and similar characteristics such as ethnicity,  
44 department, level in organization hierarchy, supervisor (Marineau et al., 2018), group  
45 membership (Brennecke & Rank, 2016; Copeland, Reynolds, & Burton, 2008), and position in  
46  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 the social network structure (Copeland et al., 2008). Knowledge workers are also more likely to  
4 seek help from those of similar organizational status (Doyle et al., 2016).  
5  
6

7  
8 Another indicator of relational commitment is the perceived quality of the relationship  
9  
10 between the resource seeker and target. A considerable body of evidence suggests a positive  
11 association between relationship quality and the likelihood of resource seeking. In most studies,  
12 the logic underlying this association is that when seekers and targets share a high quality  
13 relationship, seekers will have a higher expectancy that their request for resources will be  
14 willingly met, that the resources will be of high quality, and/or that the cost of receiving  
15 resources will be constrained by the nature of the reciprocity-based relationship. Such  
16 perceptions are grounded in the assumption that the parties share an interest in maintaining the  
17 goodwill necessary to ensure smooth, long-term social exchange (Cropanzano & Mitchell, 2005;  
18 Lawler & Yoon, 1996). Supporting this argument, research finds that relationship quality  
19 indirectly increases help seeking by reducing the perceived costs of this behavior (Anderson &  
20 Williams, 1996). Meta-analytical research also shows that relationship quality is positively  
21 related to feedback seeking behavior (Anseel et al., 2015). Furthermore, several studies have  
22 shown that employees with high (versus low) quality leader-member exchange relations (LMX)  
23 are more likely to seek feedback from their supervisors (Chen, Lam, & Zhong, 2007; Chun,  
24 Choi, & Moon, 2014; Lee, Park, Lee, & Lee, 2007; Liao & Chun, 2016).  
25  
26  
27  
28  
29  
30  
31  
32  
33  
34  
35  
36  
37  
38  
39  
40  
41  
42  
43

44 Given the connection between relationship quality and friendship (Niven, Hollman &  
45 Totterdell, 2012), it is not surprising that research on friendship in dyadic relations suggests  
46 similar effects. Fang and Shaw (2009) show that having a friendship tie in a network increases  
47 one's intention to seek justice-related information. Further, having friendship ties is positively  
48 related to the level of advice interactions on strategic issues (Westphal, 1999). Individuals are  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 also more likely to seek advice from coworkers whom they consider to be friends (Siciliano,  
4  
5 2015).

6  
7  
8 In addition, studies have examined the effects of perceived supervisor support on  
9  
10 employee resource seeking. Research shows that employees who believe that their feedback  
11  
12 seeking is likely to be supported and accepted by their supervisor tend to seek feedback more  
13  
14 often than those who do not (Whitaker, Dahling, & Levy, 2007; Williams, Miller, Steelman, &  
15  
16 Levy, 1999). Furthermore, using time-lagged data from a sample of MBA students, Beneen,  
17  
18 Pichler, and Levy (2017) find that the relationship between supervisor supportiveness and  
19  
20 feedback seeking is mediated by proactive relationship building with the supervisor. Hopkins  
21  
22 (2001) finds that employees' perceptions of their managers' support are positively related to the  
23  
24 degree to which they tend to approach their managers for help with personal problems. Overall,  
25  
26 empirical evidence shows that perceived supervisor support leads to greater resource seeking  
27  
28 behavior. Perceived support should increase the expectancy that resource seeking will yield the  
29  
30 desired benefits and decrease the expectancy of negative outcomes (e.g. embarrassment, looking  
31  
32 weak), and hence should increase the weight placed on resource acquisition over resource  
33  
34 conservation.  
35  
36  
37  
38  
39

40 Finally, studies on advice seeking have shown that workgroup identification, which is  
41  
42 reflective of commitment to the group (Cole & Bruch, 2006; Van Knippenberg & Sleebos,  
43  
44 2006), increases resource seeking, likely on account of higher expectancy that the solicitation  
45  
46 request will not be turned down as well as higher perceived value of the resources that will be  
47  
48 obtained. High workgroup identification fosters strong affective bonds (Ricketta & Van Dick,  
49  
50 2005), which facilitate high quality resource exchange. Providing support for this idea, Copeland  
51  
52 et al. (2008) find that workgroup identification increases advice seeking within groups. Further,  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 Lomi, Lusher, Parttison and Robins (2014) report that organizational members who identified  
4 more strongly with their subunits are less likely to seek advice outside of their subunits, while  
5  
6 organizational members who identified more strongly with the organization overall are more  
7  
8 likely to do so, lending support to the argument that identification is an important predictor of  
9  
10 resource seeking.  
11  
12  
13

14  
15 ***Characteristics of the work and external context: Demands, support and uncertainty.***  
16

17 Contextual demands are situational characteristics, and aspects of the task, which create  
18  
19 expectations for people to think, feel, or act in ways that are appropriate and acceptable in the  
20  
21 particular context (Blake & Davis, 1964; Pepitone, 1976). Certain contextual demands can create  
22  
23 conditions conducive for resource seeking, either by increasing the benefits associated with  
24  
25 resource seeking, reducing the likely costs, or increasing the likelihood that solicitation requests  
26  
27 will be acceded to.  
28  
29

30  
31 One such contextual demand is task interdependence. Research has shown that when task  
32  
33 interdependence is high rather than low, individuals are more likely to seek feedback (De  
34  
35 Stobbeleir, Ashford, & Zhang, 2018), information (Major & Kozlowski, 1997) and help  
36  
37 (Anderson & Williams, 1996; Bacharach, Bamberger, & Vashdi, 2005; Cleavenger, Gardner, &  
38  
39 Mhatre, 2007). There are two likely reasons for these effects. First, when tasks are more  
40  
41 interdependent, coordination among employees depends on the exchange of information,  
42  
43 feedback, and assistance, thus heightening the potential return on resources invested in soliciting  
44  
45 information, feedback, or assistance. Second, heightened task interdependence tends to  
46  
47 “normalize” resource seeking, thus reducing the perceived costs of such activity, and increasing  
48  
49 the likelihood that solicitations will be positively considered (Bacharach et al., 2005).  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 The organization's normative structure, and in particular, whether it has a climate that  
4 supports resource seeking, also influences resource-seeking activity. Organizational support for  
5 resource-seeking should increase expectancies regarding the effectiveness of this behavior, and  
6 resource-seeking should increase expectancies regarding the effectiveness of this behavior, and  
7 should also reduce the weight that employees might otherwise place on potential costs. Several  
8 studies provide evidence supporting these ideas. For example, research finds that individuals are  
9 more likely to seek feedback (Ashford & Northcraft, 1992) and help (Cleavenger et al., 2007)  
10 when there are norms supporting feedback and help seeking. In addition, positive perceptions of  
11 the feedback environment have been shown to predict feedback inquiry (Dahling, Gabriel, &  
12 MacGowan 2017; Dahling, O'Malley, & Chau, 2015; Whitaker, 2011). Similarly, Whitaker  
13 (2011) finds that perceptions of a supportive coworker feedback environment are positively  
14 related to feedback inquiry from coworkers.  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25  
26  
27

28 For newcomers, the types of formal socialization tactics used by the organization is a  
29 contextual factor that may impact resource seeking. For instance, studies have shown that  
30 institutionalized socialization tactics, which newcomers are socialized as a group and there is a  
31 clear structure to the process, positively predict both feedback and information seeking (Gruman  
32 et al., 2006; Kowtha, 2009). Another study finds the social component of organizational  
33 socialization—specifically, supervisors providing newcomers with social support and job-related  
34 information (Jones, 1986)—to be positively related to proactive information seeking (Beenen &  
35 Pichler, 2014). On the whole, these findings suggest that an organization's use of structured and  
36 supportive socialization strategies can encourage resource seeking, by helping newcomers  
37 understand what resources they need in order to adjust, which will increase the perceived value  
38 of resource acquisition (versus conservation). In addition, these socialization strategies will  
39 signal that the organization supports information and feedback exchange.

58  
59  
60

1  
2  
3 Given the presumed importance of uncertainty in motivating resource seeking, it is  
4 somewhat surprising that only the feedback and advice seeking literatures have examined how  
5 uncertainty evoked by different work and external environmental characteristics influence  
6 engagement in resource seeking. Uncertainty is likely to obstruct the attainment of work-related  
7 goals, thereby heightening the seeker's motivation to seek resources. Consistent with COR  
8 theory's gain paradox principle, uncertainty may even cause people to risk significant resource  
9 loss, as they expend time and energy in order to understand the reasons underlying the  
10 uncertainty and learn how to reduce or cope with it. That is, when faced with uncertainty, people  
11 may place more weight on resource gains, which prompts them to seek resources to buffer  
12 against further resource loss.  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25

26 Two types of uncertainty have been examined in the feedback seeking literature. One is  
27 contingency uncertainty which refers to uncertainty about the relationship between performance  
28 and valued outcomes (Anseel et al., 2015). The other is role ambiguity, which occurs when an  
29 employee is unsure about the role-related behaviors that are expected of him or her (Kahn,  
30 Wolfe, Quinn, Snoek, & Rosenthal, 1964; King & King, 1990). In their seminal empirical study  
31 on feedback seeking, Ashford and Cummings (1985) report that both forms of uncertainty  
32 increased the frequency of feedback seeking, particularly for employees with low tolerance for  
33 ambiguity. Similarly, findings from a study involving subsidiaries of multinational companies  
34 show that the greater the role ambiguity facing a subsidiary president, the higher the level of  
35 feedback inquiry (Gupta, Govindarajan, & Malhotra, 1999). However, in their meta-analysis,  
36 Anseel et al. (2015) find a *negative* relationship between uncertainty and feedback seeking, and  
37 no relationship for role ambiguity. Anseel and Lievens (2007) similarly reported a *negative*  
38 relationship between uncertainty and feedback inquiry. These results suggest that the effect of  
39  
40  
41  
42  
43  
44  
45  
46  
47

56  
57  
58  
59  
60

1  
2  
3 uncertainty on resource seeking is, at best, more nuanced than previously thought. The negative  
4 relationship does, however, make sense if considered through the lens of the primacy of loss  
5 principle of COR theory. When there is high uncertainty evoked by the perception that job  
6 demands exceed abilities, people over-weigh the image and ego costs of feedback (Ashford et  
7 al., 2016), and thus scale back on resource investments and focus more on conservation.  
8  
9

10  
11  
12 Other findings are more supportive of a *positive* effect for uncertainty-related variables.  
13  
14 For example, there is evidence that poor person-job fit increases resource seeking, presumably  
15 because lack of fit creates uncertainty about whether one can succeed in the job. Devloo, Anseel,  
16 and Beuckelaer (2011) show that the larger the gap between job demands and the seeker's  
17 abilities, the greater the likelihood of feedback seeking. Similarly, Yu and Davis (2016) theorize  
18 that achieving better fit with one's work environment to reduce uncertainty is one of the primary  
19 goals of proactive behavior (Parker & Collins, 2010), and consistent with this logic, find that the  
20 greater the misfit between the seeker's personal needs and the job environment, the higher the  
21 probability of seeking feedback and information. Hence, in line with COR theory, empirical  
22 findings suggest that resource acquisition is weighted more heavily than resource conservation  
23 under conditions of poor job fit, as the resources that may be obtained (e.g., information,  
24 feedback) can help clarify job demands and how to better meet them.  
25  
26  
27  
28  
29  
30  
31

33  
34  
35  
36  
37  
38  
39  
40  
41

42 Finally, strategic management research suggests that when the external environment  
43 becomes more uncertain or dynamic, the perceived utility of resources, and hence the resource  
44 acquisition motive, is likely to become more salient, as additional resources may be central to the  
45 organization's ability to adapt to its changing and uncertain environment. Specifically, studies  
46 have shown that as environmental dynamism and complexity increase, CEOs are more likely to  
47 rely on informal advisory systems for information and advice in making strategic decisions  
48  
49  
50  
51

59  
60

1  
2  
3 (Dyer & Ross, 2008), and are also more likely to seek external advice (Alexiev, Volberda,  
4  
5 Jansen, Van Den Bosch, 2019; Heyden, van Doorn, Reimer, Van Den Bosch, & Volberda, 2013).  
6  
7

8 **Summary.** In summary, empirical studies have examined a multitude of seeker  
9  
10 characteristics, target and relationship characteristics, and contextual factors that positively  
11  
12 predict resource seeking behavior. Specifically, there is evidence that promotion focused  
13  
14 dispositions increase the likelihood of resource seeking. Individuals with more promotion  
15  
16 focused dispositions, such as learning goal orientation and openness to experience, are likely to  
17  
18 emphasize resource acquisition and de-emphasize resource conservation, which motivates them  
19  
20 to invest their existing resources to acquire new resources. There is also robust empirical  
21  
22 evidence that greater perceived usefulness of resources prompts individuals to seek more  
23  
24 resources (e.g., Anseel et al., 2015; Asumeng, 2013; Choi, Moon, & Nae, 2014; Hays &  
25  
26 Williams, 2011; Morrison & Vancouver, 2000).  
27  
28  
29  
30

31 A number of target characteristics also increase the likelihood of seeking resources, by  
32  
33 signaling target competence and/or warmth. Furthermore, high relational commitment between  
34  
35 the seeker and the target increase resource seeking. Aligned with COR's resource investment  
36  
37 principle, these target characteristics are likely to serve as heuristics reducing the perceived  
38  
39 social cost of seeking and increasing the expectancy that the resources provided will be of high  
40  
41 quality, which prompts the seeker to place more emphasis on resource investment and  
42  
43 acquisition and less on resource conservation.  
44  
45  
46

47 In addition, contextual factors play an important role in driving resource seeking  
48  
49 behavior. Contexts where resource exchange is expected or necessary in order to achieve work-  
50  
51 related objectives, or where it is supported, reduce the social costs of seeking resources and  
52  
53 increase the expectancy that solicitations will be favorably considered. Furthermore, there is  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 empirical support for the idea that uncertainty increases resource seeking, although there is also  
4  
5 evidence, consistent with the primacy of loss principle, that high uncertainty may sometimes lead  
6  
7 to less seeking.  
8  
9

### 10 **KEY MODERATORS**

11  
12 Although the discussion above focused largely on resource seeking antecedents with  
13  
14 relatively consistent effects within and across the four literatures examined, the impact of some  
15  
16 of these antecedents may vary, being contingent upon other individual, target, and contextual  
17  
18 factors. In this section, we summarize research that has examined key moderating effects, with  
19  
20 an emphasis on moderators that have been examined across multiple forms of resource seeking.  
21  
22 Similar to our review of resource seeking antecedents, we anchor our summary in COR theory,  
23  
24 explaining how the various moderators may alter the relative strength of resource conservation  
25  
26 and resource acquisition motives.  
27  
28  
29

#### 30 **Moderators that Heighten the Salience of Resource Conservation Motive**

31  
32  
33 A variety of seeker, target and task-related characteristics moderate the effects of specific  
34  
35 resource seeking antecedents in a way that suggests that they serve to amplify the salience of  
36  
37 resource conservation. For example, Anseel and Lievens (2007) report a stronger negative effect  
38  
39 of uncertainty about one's competence on feedback seeking among individuals with a high  
40  
41 (versus low) need for certainty. As the authors argued, those with a higher need for certainty are  
42  
43 motivated to self-verify. Building on COR's desperation principle, this suggests that for such  
44  
45 individuals, uncertainty about their competence is especially likely to sap their existing  
46  
47 resources, and in so doing, place them in a position of resource depletion. This may, in turn,  
48  
49 prompt them to behave defensively and place greater weight on resource conservation over  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 resource acquisition, thus amplifying the adverse impact of competence-related uncertainty on  
4  
5 feedback seeking.  
6

7  
8         Research on relational predictors of resource-seeking suggests that their impact may vary  
9  
10 as a function of target characteristics, such as expertise. For example, in a study of employees  
11  
12 from five large banking institutions in Korea, Chun et al. (2018) demonstrated that the positive  
13  
14 relationship between LMX and leaders' tendency to seek negative feedback was weaker when  
15  
16 the target (i.e., subordinate) was perceived to have higher expertise. Apparently when the  
17  
18 subordinate had higher expertise, leaders were more driven by impression management concerns  
19  
20 (e.g., not "losing face," Kim & Nam, 1998), than by the motive to obtain useful feedback,  
21  
22 despite the high quality relationship. This suggests that, at least when the target is of lower  
23  
24 status, high target expertise may amplify the potential social costs of soliciting resources from  
25  
26 that target, and thus heighten the strength of the resource conservation motive.  
27  
28  
29

30  
31         In addition, research on how individual level factors such as occupation may affect  
32  
33 resource seeking suggests that these effects may be sensitive to the broader task context. For  
34  
35 example, task characteristics that heighten the visibility of resource seeking can make it costlier  
36  
37 for certain categories of individuals to solicit resources, thus amplifying the saliency of resource  
38  
39 conservation. Supporting this idea, in a study examining the association between occupational  
40  
41 status (doctors vs. other health professionals in a hospital) and help seeking, Lee (2002) finds  
42  
43 that nurses are more likely to seek help than physicians. However, her findings also indicate that  
44  
45 physicians are more likely to seek help when the task is routine than when it is novel, whereas  
46  
47 nurses show similar levels of help seeking regardless of the nature of the task. Explaining these  
48  
49 findings, Lee argues that as novel tasks are more central to the mission of the hospital, soliciting  
50  
51 assistance on such tasks is more noticeable than assistance solicited for more routine tasks. The  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 upshot is that this visibility increases the perceived psychological costs of help seeking for those  
4  
5 in higher status occupations, and thus, by enhancing the salience of resource conservation,  
6  
7 amplifies a negative association between occupational status and resource seeking.  
8  
9

10 Similarly, Miller and Karakowsky (2005) explored whether the gender role congruency  
11  
12 of the task would interact with the gender of the feedback seeker and/or the gender composition  
13  
14 of the group, in determining whether individuals seek feedback from team members. They found  
15  
16 that in a group where the majority of members are male, men are less likely to seek feedback  
17  
18 when performing a gender role incongruent (i.e., “female”) task than a gender role congruent  
19  
20 (i.e., “male”) task. In contrast, women in a mostly male group are less likely to seek feedback  
21  
22 when performing a gender role congruent task than a gender role incongruent task. The authors  
23  
24 concluded that gender role congruency triggers different perceptions of the nature and level of  
25  
26 resource seeking costs for men and women, with men placing a greater emphasis on the  
27  
28 reputational costs of feedback seeking (ostensibly higher when performing a “female” task in a  
29  
30 group that is predominantly male), and women viewing the costs of seeking feedback about  
31  
32 performance on a “male” task to be lower.  
33  
34  
35  
36  
37

### 38 **Moderators that Heighten the Salience of Resource Acquisition Motive**

39

40 Target, task-related and contextual characteristics may also moderate the effects of  
41  
42 various predictors of resource seeking by amplifying the salience of resource acquisition. As  
43  
44 such, these moderators are likely to strengthen the effect of antecedents positively associated  
45  
46 with resource-seeking by boosting perceptions of potential resource gain. For example, research  
47  
48 suggests that the target’s level of experience may amplify the effects of other situational  
49  
50 characteristics on the probability of resource-seeking. More specifically, McDonald et al. (2008)  
51  
52 report a positive association between board monitoring of a CEO and the likelihood of the CEO  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 soliciting advice from executives of other firms, with that association amplified as a function of  
4 those executives' prior executive experience. From a COR perspective, this amplifying effect  
5 likely operates by strengthening the signal to the advice-seeker that such executives can offer  
6 insights and suggestions more consistent with the interest of the firms' key stakeholders, thus  
7 heightening the salience of resource acquisition.  
8  
9

10  
11 Similarly, task-related characteristics may also moderate the degree to which certain  
12 resource seeking antecedents drive resource seeking, again by increasing the salience of resource  
13 acquisition. Keith et al. (2017) demonstrated this effect with regard to the moderating impact of  
14 task uncertainty on the generally positive association between advice seeking and target  
15 characteristics suggesting openness to resource requests. In a study of project teams, they found  
16 that under conditions of high task uncertainty, the positive effect of amenable target  
17 characteristics such as agreeableness and extraversion was amplified. That is, the seeker's  
18 preference for seeking advice from those with more amenable personalities was greater under  
19 conditions of higher (relative to lower) task uncertainty. The researchers explained this effect by  
20 suggesting that the stressful nature of high task uncertainty (Odriscoll & Beehr, 1994) increases  
21 the perceived value of advice received from more open and approachable targets. In other words,  
22 by increasing the salience of resource gain, higher (versus lower) task uncertainty bolsters the  
23 generally positive effect of more amenable target characteristics on advice seeking.  
24

35  
36  
37  
38  
39  
40  
41  
42  
43

44 Finally, organizational norms may serve as contextual moderators of the effect of  
45 individual-level variables on resource-seeking behavior. For example, Lee (1997) found an  
46 interaction between gender and collectivistic organizational norms in predicting help seeking.  
47 Specifically, male employees in hospitals characterized by collectivistic norms were more than  
48 twice as likely to seek help than male employees in hospitals characterized by individualistic  
49  
50  
51

54  
55  
56  
57  
58  
59  
60

1  
2  
3 norms, whereas the help seeking behavior of female hospital employees was not affected by  
4 these norms. These findings suggest that, for men (but not women), collectivistic norms may  
5 shift the focus away from the psychological costs of help-seeking and amplify the saliency of  
6 potential resource gain.  
7  
8  
9  
10

11  
12 **Summary.** Empirical research has identified a number of variables, cutting across  
13 different levels of analysis, which condition the effects of various resource seeking antecedents.  
14 Although each of these moderators has tended to be studied in the context of a specific type of  
15 resource seeking behavior and a specific set of antecedents, their moderating effects may apply  
16 more broadly. It is also worth noting that certain critical *predictors* of resource seeking, such as  
17 uncertainty, target expertise, and organizational norms, also serve as key *moderators* of other  
18 predictors. In other words, these factors both directly influence resource seeking and condition  
19 the effects of other resource seeking antecedents. In both cases, the findings are consistent with  
20 the idea that both individual and contextual factors can shift the seeker's focus toward either  
21 resource acquisition or conservation.

### 35 **OUTCOMES OF RESOURCE SEEKING**

36  
37  
38 Resource seeking can have both positive and unintended negative outcomes, not just for  
39 the person engaging in the behavior, but also for the work unit or organization. We discuss those  
40 outcomes here. Similar to our review of resource seeking antecedents, we focus on outcomes that  
41 have been most commonly and widely studied, with the most robust empirical evidence base. We  
42 first discuss the positive outcomes of resource seeking, at the individual, team, and organization  
43 levels respectively, and then discuss negative outcomes at these different levels (see Table 4), in  
44 both cases highlighting potential contingency factors that may amplify, attenuate or even reverse  
45 these relationships.

## Positive Outcomes

*Individual-level.* There is considerable empirical evidence showing resource seeking to be beneficial for the individual. Specifically, studies have shown all four forms of resource seeking to be associated with stronger objective performance (e.g., Ashford & Tsui, 1991; Chen et al., 2007; Cheramie, 2013; Lam, Huang, & Snape, 2007) and higher ratings of performance (e.g., Anseel et al., 2015; Ashford & Tsui, 1991; Chen et al., 2007; Dahling et al., 2012, 2015; Friedman et al., 2018; Huang, 2012; Lee & Duffy, 2019; Morrison, 1993b; Nifadkar & Bauer, 2016; Nifadkar, Wu, & Gu, 2019; Otte, Konradt, Garbers, & Schippers, 2017; Reio & Wiswell, 2000; Renn & Fedor, 2001; Srikanth & Jomon, 2013; Whitaker et al., 2007; Williams & Johnson, 2000; Wu et al., 2014). Adopting the lens of COR theory, these positive effects on performance may be viewed as downstream consequences stemming from primary resource gains. For example, the individual gains information that provides role clarity (Brown, Ganesan, & Challagalla, 2001; Nifadkar & Bauer, 2016; Whitaker et al., 2007), or assistance that facilitates task accomplishment, and these in turn contribute to better performance.

However, the literature also suggests that the positive association between resource seeking and performance ratings depends, at least in part, on the perceived motive of the seeker. Dahling et al. (2015) report that feedback inquiry has a strong positive relationship with task performance ratings only for employees with low image enhancement motives. Similarly, Lam et al. (2007) find that there is a positive relationship between feedback seeking and LMX quality, which in turn leads to higher performance ratings, but only when the seeker is viewed as having a strong performance enhancement motive (versus an image enhancement motive).

1  
2  
3 Target expertise is another variable that research suggests will moderate the relationship  
4 between resource seeking and positive outcomes for the seeker. Specifically, Brooks et al. (2015)  
5 find that advice seekers are evaluated as more competent by the target when the target views  
6 him/herself as an expert. In contrast, when targets view themselves as non-experts, advice  
7 seeking decreases the target's evaluation of the seekers' competence. In the domain of help  
8 seeking, Nadler and colleagues (2003) demonstrate that help seeking leads to more favorable  
9 performance evaluations when the target (i.e., help giver) is perceived as having more expertise,  
10 but less favorable performance evaluations when the target is perceived as having less expertise.  
11  
12  
13  
14  
15  
16  
17  
18  
19  
20

21 Research further suggests that the relationship between resource seeking and performance  
22 evaluations may not always be monotonic. At least in the context of help seeking, Nadler et al.  
23 (2003) show that the relationship may instead be curvilinear. They found that superiors are likely  
24 to positively evaluate the performance of employees who asked for help, but only up to a certain  
25 high level, beyond which evaluations become more negative. Indeed, COR theory suggests that  
26 excessive help seeking may result in resource losses, in the form of a less favorable image or  
27 reduced self-confidence. Excessive help seeking may also trigger negative evaluations by  
28 supervisors and peers because it draws them away from the tasks that they need to complete or  
29 creates a sense of inequity in reciprocal relations (Nahum-Shani & Bamberger, 2011).  
30  
31  
32  
33  
34  
35  
36  
37  
38  
39  
40  
41

42 Aside from examining the beneficial effects of resource-seeking on objective  
43 performance and task performance ratings, empirical studies have also examined its effects on  
44 employee creativity (De Stobbeleir, Ashford, & Buyens, 2011; Mueller & Kamdar, 2011;  
45 Sijbom, Anseel, Crommelink, De Beuckelaer, & De Stobbelier, 2018). For instance, in a study of  
46 engineers working in a large multinational refinery in India, Mueller and Kamdar (2011) report a  
47 positive association between employee help seeking and creativity. The authors argued that this  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 positive effect may be explained by the fact that help seeking requires employees to engage in  
4 exploration and consideration of diverse perspectives. Findings regarding the association  
5  
6 between feedback seeking and creativity-related outcomes are more nuanced. Liao and Chun  
7  
8 (2016) report that whereas seeking feedback on outcomes is positively correlated with idea  
9  
10 generation, seeking feedback about how one approaches work tasks is positively correlated with  
11  
12 idea dissemination and implementation.  
13  
14  
15

16  
17 Research also suggests beneficial effects of resource seeking for employee turnover  
18 intentions. Soltis, Agneessens, Sasovova, and Labianca (2013) find that employees who are able  
19  
20 to obtain advice from those not required to help have lower levels of turnover intentions than  
21  
22 those less able to do so. Similarly, studies indicate that employees who seek feedback and  
23  
24 information from their supervisor and coworkers are less likely to quit (Bauer, Bodner, Erdogan,  
25  
26 Truxillo, & Tucker, 2007; Dahling et al., 2017; Nifadkar et al., 2019; Wanberg & Kammeyer-  
27  
28 Mueller, 2000). One reason may be that resource seeking facilitates the attainment of positive  
29  
30 career outcomes such as promotion, which may, in turn, motivate individuals to remain with  
31  
32 their organizations (Dimotakis et al., 2017).  
33  
34  
35  
36

37  
38 In addition, each of the four literatures has shown positive effects of resource seeking on  
39  
40 job-related attitudes. Employees who seek more feedback and information have been shown to  
41  
42 experience greater job and career satisfaction (Anseel et al., 2015; Asumeng, 2013; Bauer et al.,  
43  
44 2007; Bauer, Perrot, Liden, & Erdogan, 2019; Saks, Gruman, & Cooper-Thomas, 2011;  
45  
46 Wanberg & Kammeyer-Mueller, 2000). Employees who seek more feedback and information are  
47  
48 also likely to have higher feelings of intrinsic motivation, task mastery, role clarity, social  
49  
50 integration, person–job fit, person–organization fit, job self-efficacy, and organizational  
51  
52 commitment (e.g., Anseel et al., 2015; Bauer et al., 2007; Bauer & Green, 1998; Dahling et al.,  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 2017; Dimotakis et al., 2017; Ellis, Nifadkar, Bauer, & Erdgogan, 2017; Gruman et al., 2016;  
4  
5 Morrison, 1993a, 1993b; Nifadkar & Bauer, 2016; Saks et al., 2011; Vandenberghe et al., 2019;  
6  
7 Whitaker et al., 2007; Yu & Davis, 2016). In a study of expatriates, seeking advice from  
8  
9 coworkers was shown to be positively related to work and interaction adjustment (Mahajan &  
10  
11 Toh, 2014). Another study finds feedback seeking from supervisors to be positively related to  
12  
13 supervisor identification, and feedback seeking from coworkers to be positively related to  
14  
15 workgroup identification (Young & Steelman, 2014). Building on COR's resource investment  
16  
17 principle, these findings suggest that resource seeking facilitates the development of more  
18  
19 favorable workplace and job attitudes, which in turn provide the foundation for additional  
20  
21 resource investment and gain.  
22  
23  
24  
25

26  
27 Resource seeking can also strengthen the quality of workplace relationships. For  
28  
29 instance, research suggests that employees who seek more feedback are likely to have higher  
30  
31 quality LMX (Dahling et al., 2012; Lam et al., 2007). Zheng et al. (2016) report similar effects  
32  
33 for newcomer information seeking. Specifically, they found that newcomers who engaged in  
34  
35 more information seeking experienced higher quality LMX with their new supervisor, which in  
36  
37 turn predicted lower psychological strain and turnover intention, and more extra-role behavior.  
38  
39

40 ***Team-level.*** Empirical research examining the positive effects of resource seeking at the  
41  
42 team level has been mostly conducted in the information seeking and advice seeking literatures.  
43  
44 Within those literatures, there is consistent evidence of a positive effect on team performance,  
45  
46 with studies suggesting team learning as the underlying mechanism contributing to better team  
47  
48 performance (Konradt, Otte, Schippers, & Steenfatt, 2016; Schippers, Homan, & Van  
49  
50 Knippenberg, 2013). For example, a network study finds that teams with leaders who are more  
51  
52 central in an advice network (i.e., those who seek and receive more advice from subordinates)  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 perform better than teams whose leaders are less central (Balkundi, Kilduff, & Harrison, 2011).

4  
5 Furthermore, leaders who seek and receive feedback from subordinates are perceived to have  
6  
7 more charisma, which in turn positively predicts team performance (Balkundi et al., 2011).

8  
9  
10 Another study finds that advice network density is positively related to team performance (Zhang  
11  
12 & Peterson, 2011). Otte et al. (2017) corroborate this pattern of results, showing that team  
13  
14 information-seeking is positively related to team learning and information sharing behaviors.

15  
16 They also demonstrate that both the quantity and quality of team information-seeking is  
17  
18 positively related to team performance. Consistent with COR theory, these findings suggest that  
19  
20 resource seeking at the team level yields resource gains, in the form of team learning and  
21  
22 enhanced team capabilities, which may facilitate positive team-level performance outcomes.  
23  
24  
25

26 ***Organization-level.*** Relative to research on individual and team-level outcomes, there has  
27  
28 been less research on organizational level outcomes of resource seeking. One likely reason is that  
29  
30 the feedback, information, and help seeking literatures are rooted in the premise that employees  
31  
32 seek these as *personal* resources to help achieve *personal* goals. As such, studies have largely  
33  
34 focused on implications of resource seeking behavior for the individual seeker. It is mainly in the  
35  
36 literature on CEO and top management team (TMT) advice seeking that this behavior has been  
37  
38 framed as a firm-level strategic behavior with implications for the organization. It is also worth  
39  
40 noting that within the organizational literature more broadly, there is a relative scarcity of  
41  
42 research linking employee-level behaviors to macro-level outcomes, likely because of the  
43  
44 difficulty of conducting such cross-level research and of establishing causality across levels.  
45  
46  
47  
48

49  
50 Nevertheless, empirical research consistently demonstrates that top executive resource  
51  
52 seeking is positively associated with firm performance, with the primary mechanisms being team  
53  
54 potency—generalized beliefs about the team’s capabilities across tasks and contexts (Gully,  
55  
56  
57  
58  
59  
60

1  
2  
3 Incalcaterra, Joshi, & Beaubien, 2002)—and the acquisition of more diverse and useful  
4 knowledge, which are different forms of resource gain. In a sample of CEOs and TMT members  
5 from 65 firms, Ashford and colleagues (2018) find that CEO feedback seeking is positively  
6 related to firm performance, with this effect mediated by TMT potency. In another study of 263  
7 CEOs, Westphal (1999) finds that the amount of advice interactions is positively related to firm  
8 performance, operationalized as return on equity and market-to-book value. According to the  
9 author, this effect is driven by a greater breadth of knowledge and fresh perspectives derived  
10 from advice seeking. Following the same logic, Dyer and Ross (2008) find that small business  
11 owners who engage in more frequent advice seeking report more favorable business  
12 performance.

17  
18  
19  
20  
21  
22  
23  
24  
25  
26 Resource seeking's organizational-level effects also extend to innovation. For example,  
27 research documents a positive effect of TMT external advice seeking on both the utilization of  
28 external innovation practices and a firm's entrepreneurial orientation (Alexiev, den Hertog, &  
29 van Dijk., 2012). In a study of Dutch employees from small and medium-sized firms across a  
30 variety of industries, Alexiev et al. (2010) report that both internal and external advice seeking  
31 contribute to exploratory innovation, although internal advice seeking has a stronger influence.  
32 The authors argued that this difference may reflect in-group favoritism or out-group derogation  
33 (Katz & Allen, 1982). Further, Alexiev et al. (2010) find that the relationship between internal  
34 advice seeking and exploratory innovation is strengthened by top management team (TMT)  
35 heterogeneity. The authors argue that these effects may occur because heterogeneous TMTs are  
36 able to connect to a more diverse pool of potential advisors of varying expertise (Hambrick,  
37 1994), and have greater absorptive capacity—the ability to filter, process, and assimilate new  
38 information (Van den Bosch, Volberda, & de Boer, 1999; Zahra, Filatotchev, & Wright, 2009).

2  
3       **Summary.** A sizable body of research suggests that resource seeking is associated with  
4 positive individual-level outcomes. At the team level, resource seeking is related to enhanced  
5 team performance, most likely driven by improved team capabilities brought about through team  
6 learning and more efficient team processes and effective leadership behaviors. At the  
7 organization level, research shows that resource seeking can be associated with better firm  
8 performance and firm innovation, where these benefits are likely due to enhanced team potency  
9 and the leveraging of external networks and acquisition of more diverse knowledge. Thus, the  
10 positive effects of resource seeking extend across different levels. As suggested by COR theory,  
11 initial resource gains can propel future resource gains. Specifically, the resources obtained by  
12 individuals or teams may put them in a more favorable position to further invest their accrued  
13 resources to obtain additional resources that lead to positive downstream outcomes.

### 28 **Negative Outcomes**

29  
30       **Individual-level.** Although most of the empirical evidence on resource seeking outcomes  
31 suggests positive effects, there are studies hinting that there may sometimes be negative effects  
32 for the seeker. Underlying such negative consequences is the fact that resource seeking requires  
33 resource investment. Accordingly, when people seek resources, they may incur primary resource  
34 loss, at least in the short run. These losses can be either intangible or tangible in nature.  
35  
36 Intangible losses relate primarily to the resource seeker's reputation or interpersonal relations.  
37 For example, in a series of field and experimental studies, Rosette, Mueller, and Lebel (2015)  
38 find that help seeking by leaders may negatively influence others' perceptions of them as leaders.  
39  
40 However, this backlash applied only to males, suggesting that reputation is negatively affected  
41 when resource seeking is incongruent with agentic traits typically associated with men, and thus  
42 interpreted as a sign of weakness or low competence (Good, Dell, & Mintz, 1989; Lee, 1997).

58  
59  
60

1  
2  
3 A social network study by Agnessens and Wittek (2012) suggests that resource seeking  
4 may also engender negative relational outcomes. In particular, their findings indicate that active  
5 advice seekers are more likely to be avoided by active advice givers than by individuals who do  
6 not frequently provide advice. Active givers may be concerned that they have to allocate their  
7 time and effort to provide advice at the expense of their own work tasks, or at the expense of  
8 others who may need the advice more. Recent research also finds that people interpersonally  
9 penalize those who seek, but then fail to take, their advice (Blunden, Logg, Brooks, John, &  
10 Gino, 2019), and that such unhealthy dynamics can result in interpersonal strain.  
11  
12  
13  
14  
15  
16  
17  
18  
19  
20

21 ***Team-level.*** There is empirical evidence, albeit limited, suggesting that resource seeking  
22 may in some cases negatively impact team outcomes. For example, resource seeking by  
23 members of a team may limit the time and effort available for team tasks, which may impede  
24 team performance. Supporting this idea, Bamberger and Levi (2009) report that while help  
25 seeking may result in the enhancement of team members' capabilities, at least in the short run,  
26 with members soliciting and providing assistance to one another, the team pays a price with  
27 detriments in immediate team performance.  
28  
29  
30  
31  
32  
33  
34  
35  
36

37 ***Summary.*** Although not as robust as the evidence for positive outcomes, there is  
38 evidence suggesting that resource seeking may sometimes result in negative outcomes for the  
39 seeker. Specifically, employees who seek resources may suffer primary resources losses, such as  
40 reputational and interpersonal harm or the depletion of time and energy. At the team level, there  
41 is some evidence suggesting that team performance may suffer, at least in the short run,  
42 following resource seeking. Consistent with COR theory, these findings suggest that resource  
43 investments directed toward resource seeking can be significant and may not necessarily allow

2  
3 one to reap benefits in the short term. However, the resource gains, if and when accrued from  
4 resource investments, may outweigh the resource losses in the longer term.  
5  
6

7  
8 Overall, our review supports the assumption within the four literatures that resource  
9 seeking is a beneficial behavior. Nonetheless, there may be a “dark side,” as highlighted in the  
10 advice and help seeking literatures. Our conclusion from the review of the evidence is that  
11 advice and help seeking literatures. Our conclusion from the review of the evidence is that  
12 resource seeking involves trade-offs and does not unequivocally lead to positive outcomes. At  
13 the individual level, seekers may incur unintended primary resource losses, such as reputational  
14 and interpersonal costs. In the long run, these resource losses may affect subsequent decisions to  
15 seek resources and potentially hinder people from acquiring resources. Although there is less  
16 evidence of a negative impact of resource seeking on team outcomes, such outcomes cannot be  
17 ruled out, as resources invested by team members in resource seeking and provision may be  
18 shifted away from task-related activities. In addition, resource seeking by top executives may not  
19 necessarily yield positive outcomes for their firm if such resource solicitation is directed towards  
20 those with whom the executives have strong ties, as this can limit the firm’s exploration of  
21 diverse knowledge sources and place constraints on its strategic flexibility (McDonald &  
22 Westphal, 2003).

#### 40 **FUTURE DIRECTIONS**

41  
42 Our review, spanning across several decades of empirical research, has highlighted a  
43 broad range of antecedents and outcomes of resource seeking behavior, as well as important  
44 boundary conditions. In addition to integrating findings across the different bodies of literature,  
45 we have used the main principles of COR theory to provide a more holistic and theoretically-  
46 grounded view of resource seeking in the workplace. Yet COR theory also provides a basis for  
47 examining several poorly understood aspects of resource seeking. In particular, as a dynamic  
48  
49  
50  
51  
52  
53  
54  
55  
56

58  
59  
60

1  
2  
3 theory, it provides a framework to better understand the path-dependent nature of resource-  
4 seeking and how such behavior can vary as much within-persons as between persons. Moreover,  
5 the heuristic considerations implied in COR theory offer a starting point for exploring questions  
6 beyond just whether or how frequently resource seeking occurs, laying the groundwork for  
7 research on the timing and targeting of such behavior. In addition, COR theory hints at some  
8 ways to resolve some of the inconsistent findings in the literature.

12  
13  
14  
15

### 16 **Dynamic Within-Person Research**

17  
18  
19 COR is a dynamic theory (Halbesleben et al., 2014), and its application brings to light the  
20 dynamic nature of resource seeking, as employees try to maintain an optimal balance between  
21 resource conservation and acquisition through a process of self-regulation. Building on this  
22 foundation, we believe there is considerable opportunity for future research to adopt a dynamic,  
23 within-person approach to examining resource seeking behavior. Qualitative studies may offer a  
24 useful starting point for such research, with experiential sampling designs (e.g., Koopman, Lanaj,  
25 & Scott, 2016) providing a means by which to explore self-regulation processes across multiple  
26 resource seeking episodes. For example, even if resources such as information or advice are  
27 sought and provided, significant uncertainty may still remain if the resources obtained are of low  
28 quality or introduce ambiguity. In such situations, even though the solicitation effort yielded the  
29 requested resources, the effort failed to achieve its overarching objective. If this occurs, resource  
30 loss may become salient as the seeker has not only diminished his/her inventory of time and  
31 energy, but may also have suffered the loss of more intangible resources such as self-efficacy  
32 and/or reputation. In this case, COR theory suggests that employees may not only continue to  
33 invest resources to secure the desired resource and recover from a situation of resource depletion,  
34 but that they may do so in an increasingly maladaptive and inefficient manner, resulting in  
35  
36

56  
57  
58  
59  
60

1  
2  
3 secondary resource loss. Such a dynamic can be explained by the desperation principle of COR  
4 theory, which suggest that sometimes efforts to recover from resource loss are driven by an  
5 increasing tendency to overweight the likelihood of additional resource loss. Such overweighting  
6 of potential resource loss can misguide further resource seeking, reduce the probability of  
7 success, and further deplete the resource seeker's pool of personal resources, generating resource  
8 loss spirals that can increase in momentum and magnitude (Hobfoll et al., 2018). Eventually, the  
9 seeking efforts are likely to subside, as the person's resources become depleted, but not without  
10 significant personal costs. The application of COR theory opens the door to capturing such  
11 spirals of resource losses. However, it is only by studying patterns of resource seeking over time  
12 and at the within-individual level can we begin to unravel such dynamic patterns.  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25

26 Building on the argument that future research needs to adopt a more dynamic perspective  
27 of employee resource seeking, it is worth noting two feedback loops that have been suggested in  
28 the literature (e.g., Anseel et al., 2015; Grodal, Nelson, & Siino, 2015; Newark et al., 2014), and  
29 deserve greater research attention. First, the literature suggests a feedback loop at the dyadic  
30 level (Anseel et al., 2015), reflecting the bi-directional pattern of influence between seeker and  
31 target and the iterative nature of resource seeking. Whereas characteristics of the target, or of the  
32 relationship between the seeker and target, may affect resource seeking, resource seeking may in  
33 turn impact the target or the relationship, which may then have implications for subsequent  
34 resource seeking behavior. The feedback loop might be either positive (e.g., trust leads to more  
35 information seeking, and information obtained leads to even more trust), or negative (e.g., low  
36 LMX leads to less resource seeking, which in turn leads to diminished LMX, and so on).  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47  
48  
49  
50

51 The second feedback loop reflects how resource seeking can create and perpetuate a  
52 healthy cycle of mutual resource solicitation and provision through the reinforcement of  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 reciprocity norms (Golan & Bamberger, 2015; Grodal et al., 2015). By exchanging resources,  
4  
5 both the seeker and target should expect to achieve an efficient exchange of resources in the long  
6  
7 term, because they learn about each other's underlying interests and values (Molm & Cook,  
8  
9 1995), thus enabling them to efficiently allocate resources over time (Flynn, 2003). These  
10  
11 positive feedback loops may also extend beyond the dyad to the team and even the organization  
12  
13 level (Hobfoll et al., 2018). Indeed, COR theory (Hobfoll et al., 2018) suggests that  
14  
15 organizational factors may foster and promote, or alternatively impede and block, resource  
16  
17 creation and sustenance. One question to consider, therefore, is how both individual and  
18  
19 collective performance might be enhanced in organizations with strong resource seeking and  
20  
21 giving routines. Organizations that facilitate the solicitation of valued resources, and thereby  
22  
23 foster sustained and regulated patterns of resource exchange (Bolino, Harvey, & Bachrach, 2012;  
24  
25 Burke & Weir, 1978), may develop more collaborative organizational cultures. In addition,  
26  
27 resource exchange at the team or organizational level may be fundamental to creating and  
28  
29 sustaining engaged and resilient teams and organizations (Hobfoll et al., 2018).  
30  
31  
32  
33  
34

### 35 **Timing and Targets of Resource Seeking**

36  
37 To date, there is relatively little empirical research that examines predictors or outcomes  
38  
39 of the timing of resource seeking. Yet timing—whether one immediately seeks or delays the  
40  
41 seeking of a given type of resource—may have important individual and organizational  
42  
43 implications. For example, when help seeking is delayed in the context of an urgent problem, it  
44  
45 could lead to that problem escalating (Vashdi, Bamberger, & Bacharach, 2012). Whether  
46  
47 employees seek resources to tackle an issue in its nascent stage or hold off until later, when it has  
48  
49 morphed into a more complex and multi-faceted issue, can have significant implications for  
50  
51 performance. On one hand, COR theory suggests that when people delay resource seeking, the  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 problem may aggravate, thus threatening or even further depleting current resources. Further, if  
4  
5 they eventually do decide to seek resources to address the problem, consistent with the corollary  
6  
7 of the desperation principle, their already depleted personal resources may reduce the likelihood  
8  
9 that they will do so in an effective and efficient manner, resulting in secondary resource losses  
10  
11 and initiating or exacerbating resource loss spirals. On the other hand, when people encounter a  
12  
13 problem and seek resources immediately, they may develop a dependent resource seeking logic  
14  
15 which may stunt their ability to learn and gain mastery of the situation (Geller & Bamberger,  
16  
17 2012). As informed by the gain paradox principle, the seeker's current resource status may be a  
18  
19 key factor determining the optimal timing of resource seeking. For example, when a potential  
20  
21 seeker has experienced recent resource loss, he/she is likely to place greater emphasis on  
22  
23 resource acquisition than resource conservation, and therefore promptly seek resources to resolve  
24  
25 the problem, so as not to incur further resource losses by delaying resource seeking. Overall,  
26  
27 future research should give more consideration to issues of timing and examine the boundary  
28  
29 conditions that determine the optimal timing of resource seeking.  
30  
31  
32  
33  
34

35  
36 There is also a need for future studies to focus more on decisions about the target of  
37  
38 resource seeking, and how seekers balance resource conservation and acquisition when making  
39  
40 these decisions. Although our review has outlined how the characteristics of the target and the  
41  
42 dyadic relationship between the seeker and the target impact resource seeking, there is relatively  
43  
44 little research that examines how the seeker selects from among a pool of potential targets and  
45  
46 the factors that influence these decisions. One important factor that is likely to affect this choice,  
47  
48 by determining whether the seeker prioritizes resource acquisition over conservation, is the  
49  
50 severity of the problem. For instance, when the problem is severe, people may be more likely to  
51  
52 select a target with high expertise even if the target is not very accessible or might not comply,  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 because the cost of not solving the critical problem is high, which should be weighted more  
4 heavily than the cost of being rejected. Another key factor could be the seeker's current resource  
5 state. Based on the gain paradox and desperation principles, when people have suffered recent  
6 resource losses, they are more likely to overweigh potential gains, and may adopt inefficient  
7 strategies of resource conservation and recovery, by for example selecting a target who lacks  
8 expertise but is more likely to agree to the solicitation request. In sum, it would be useful to  
9 investigate the factors that influence these decisions so as to better understand how resource  
10 seeking can be more effective.  
11  
12  
13  
14  
15  
16  
17  
18  
19  
20

### 21 **Resolving Inconsistent Findings**

22  
23  
24 Although our review reveals strong evidence of positive effects of resource seeking, there  
25 is also evidence suggesting the possibility of negative outcomes. For example, an employee may  
26 invest resources into soliciting input or help, and then realize that the resources provided by the  
27 target are neither useful nor of high quality, resulting in primary resource loss in the form of  
28 reduced performance capabilities. COR theory's desperation principle and its corollary suggest  
29 that this employee may also incur secondary resource losses due to inefficient allocation of  
30 resources from an already reduced pool (Li, Wang, Yang, & Liu, 2016; van Woerkom, Bakker,  
31 & Nishii, 2016). In addition, he or she may incur reciprocation costs (Mueller & Kamdar, 2011;  
32 Siciliano, 2015). However, we do not have a very good understanding of the conditions that may  
33 engender these negative outcomes. Thus, we encourage future research focused on understanding  
34 when resource seeking is beneficial and when it is more harmful.  
35  
36  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47  
48

49 Our review unveiled some other areas with inconsistent findings that also call for  
50 additional research. For example, performance goal orientation (PGO) is amongst the most  
51 widely examined antecedents within the feedback seeking literature. PGO is characterized by an  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 emphasis on demonstrating and validating the adequacy of one's competence by seeking  
4 favorable judgments and avoiding negative judgments about one's ability (Dweck & Leggett,  
5 1988). Whereas some studies show that PGO is positively related to feedback seeking (e.g.,  
6 Anseel et al., 2015; Parker & Collins, 2010; Tuckey et al., 2002), others show a negative effect  
7 (e.g., VandeWalle & Cummings, 1997; Whitaker & Levy, 2012). We speculate that these mixed  
8 findings stem from the failure to consider the two different facets of PGO: performance-prove  
9 and performance-avoid (see Vandenberghe et al., 2019, for an exception). Whereas the former  
10 reflects the desire to demonstrate one's ability and to gain favorable evaluations about it, the  
11 latter reflects the desire to avoid the disproving of one's ability and to avoid negative evaluations  
12 about it (VandeWalle, 1997). Using a COR theory lens, we suggest that individuals with a  
13 stronger performance-avoid orientation may prioritize resource conservation over resource  
14 acquisition, which will reduce the likelihood of feedback seeking. To reconcile these discrepant  
15 findings, future research should assess the two distinct dimensions of PGO. Research should  
16 also examine whether these dimensions predict other forms of resource seeking.

Another commonly studied antecedent with equivocal empirical results is the status difference between the seeker and the target. Underlying research on dyadic status relations and resource seeking is the notion that status can be a double-edged sword (van der Rijt et al., 2013). On one hand, people may weigh the perceived utility of resource seeking from higher status targets as higher. Consistent with this idea, research shows that employees are more likely to seek feedback (van der Rijt et al., 2013), information (Fang & Shaw, 2009), advice (Marineau et al., 2018), and help (Lee, 1997, 2002) from higher status individuals than from lower status individuals. Furthermore, employees are more likely to seek help from supervisors than from coworkers (Nadler et al., 2003). On the other hand, if the hierarchical or status gap is too large,

1  
2  
3 the target may not be easily accessible and/or may be too far removed to provide appropriate  
4 resources. Supporting this idea, Bono and Anderson (2005) find employees to be less likely to  
5 seek advice from top managers than from lower level managers. One explanation may be that  
6 employees ascribe higher expected utility to resources requested from those having an  
7 organizational status similar to their own. Indeed, Doyle et al. (2016) show that individuals are  
8 most likely to *provide* help to those at moderate status distances from themselves. These findings  
9 point to the possibility of curvilinear effects of status difference on resource seeking. Future  
10 empirical studies should test this possibility and also examine the tipping point at which the  
11 resource conservation motive outweighs the resource acquisition motive.

## 24 CONCLUSION

25  
26 Given the complex, dynamic, and uncertain nature of work and organizations, resource  
27 seeking is recognized by organizational researchers as a critically important behavior for  
28 enhancing individual and collective effectiveness. To date, organizational scholars have studied  
29 four highly related forms of this behavior: feedback seeking, information seeking, advice  
30 seeking, and help seeking. Despite commonalities across these four behaviors, research on them  
31 has existed in largely distinct silos, making it difficult to appreciate the common threads or apply  
32 insights from one literature to another. In this review, our goal has been to review the empirical  
33 research on antecedents and outcomes of resource-seeking behaviors, in a way that provides not  
34 only conceptual integration, but also a broader and more nuanced understanding. By utilizing  
35 COR theory as our integrating framework, we have been able to more parsimoniously explain  
36 when people are most likely to seek resources, how resource seeking influences work outcomes,  
37 and why and when both sets of relationships may diverge from what would be expected on the  
38 basis of uncertainty reduction and cost benefit models. In addition, we have demonstrated how

Table 1

## Conceptual Comparison of the Feedback, Information, Advice, and Help Seeking Literatures

	Feedback Seeking	Information Seeking	Advice Seeking	Help Seeking
Definition	The “conscious devotion of effort toward determining the correctness and adequacy of behavior for attaining valued end states” (Ashford, 1986, p. 466).	The act of seeking job-related and organizational information to cope with uncertainty and engage in sense-making (Miller & Jablin, 1991; Saks & Ashforth, 1996)	The deliberate information exchange with other individuals as part of the process of forming opinions, attitudes, and judgments (Bonaccio & Dalal, 2006).	The solicitation of emotional or instrumental assistance to manage some problem either at or outside of work (Bamberger, 2009).
Dominant theoretical framework	Uncertainty reduction	Uncertainty reduction	Social network perspective	Cost benefit analysis
Measurement	<ul style="list-style-type: none"> <li>• Most of the research has used an aggregate measure of feedback seeking</li> <li>• Others have distinguished between two distinct forms of feedback seeking: inquiry and monitoring (Anseel et al., 2015; Morrison, 1995).</li> <li>• Researchers have sometimes borrowed and modified measures from the information seeking literature.</li> <li>• Example items: seeking feedback about “overall work performance, technical performance on the job, supervisors’ role expectations, social behaviors”</li> <li>• e.g., Lam et al. (2007), VandeWalle et al. (2000)</li> <li>• Example item for inquiry: “How frequently do you directly ask <i>NAME</i> for feedback about your work?”,</li> <li>• Example item for monitoring: “How frequently do you pay attention to how <i>NAME</i> acts toward you in order to understand how he/she perceives and evaluates your work?”</li> <li>• e.g., Ashford (1986), De Stobbeleir et al. (2011)</li> </ul>	<ul style="list-style-type: none"> <li>• The first empirically validated and commonly used measure was from Morrison’s (1993) work.</li> <li>• VandeWalle et al. (2000) modified Morrison’s (1993) scale and created a measure focused specifically on task-related information.</li> <li>• Researchers have sometimes borrowed and modified measures from the feedback seeking literature</li> <li>• Example items: seeking information about “Expected performance standards, technical aspects of the job, how to perform official tasks, how to solve task-related problems, the company’s task-related expectations of you”</li> <li>• e.g., Brown et al. (2001), Major &amp; Kozlowski (1997), Morrison (1993), Nifadkar &amp; Bauer (2016), VandeWalle et al. (2000)</li> </ul>	<ul style="list-style-type: none"> <li>• No common, widely used scale, but there are common items across different advice seeking measures.</li> <li>• Most studies use only 1-2 items because they gather social network data.</li> <li>• Example item: “How often during the past <i>X</i> months did you go to <i>NAME</i> if you needed advice for a work-related problem?”</li> <li>• e.g. Alexiev et al., (2010), Bono &amp; Anderson (2005), Brooks et al. (2015), Lee &amp; Duffy (2018), McDonald et al. (2008)</li> </ul>	<ul style="list-style-type: none"> <li>• Measures are often tailored to experimental context or field setting, e.g., reporting actual number of people one sought help from, observational measures (e.g. Bohn et al., 2010; Cleavenger et al., 2007, Lee, 1997), or specific kind of help seeking (e.g. Hoffman et al., 2009)</li> <li>• Measures used in social network studies usually contain only 1-2 items <ul style="list-style-type: none"> <li>○ Example item: “Indicate the extent to which you had sought task-related help (i.e., “assistance with technical or practical work-related problems”) from <i>NAME</i>”</li> <li>○ e.g. Anderson &amp; Williams (1996), Geller &amp; Bamberger (2012), Lee (2002), Nadler et al. (2003), Rosette et al. (2015)</li> </ul> </li> <li>• Another set of papers uses Anderson and Williams’ (1996) scale to measure help seeking as rated by either seeker or giver. <ul style="list-style-type: none"> <li>○ Example item: “<i>NAME</i> often asks me to assist her/him with certain tasks or projects”,</li> </ul> </li> </ul>
Context/Motivator	Uncertainty	Uncertainty	A decision	A problem
Target of solicitation	Mostly supervisor, sometimes peers/coworkers	Mostly supervisor/mentor, sometimes peers/coworkers	Intraorganizational and extraorganizational peers	Mostly peers/coworkers, sometimes supervisor/leader

Focus	Improving performance	Reducing uncertainty	Making decision or choice	Solving a work or personal problem
Exchange/reciprocity	Not necessarily	Not necessarily	Not necessarily	Yes
Prescriptive	Sometimes	Not generally	Yes	Not generally
Temporal focus	Retrospective	Retrospective/ Prospective	Prospective	Prospective
Considers future resource solicitation from the same target	Limited theory and limited empirical evidence, for exceptions see Anseel’s et al. (2015)	Limited theory and no empirical evidence	Limited theory and limited empirical evidence, for exceptions see Blunden et al. (2019)	Limited theory and limited empirical evidence, for exceptions see Grodal et al. (2015) and Golan & Bamberger (2015).

Table 2

## COR Theory's Applications to Resource Seeking

Basic tenets of COR Theory	COR Theory Application to Resource Seeking
Principle 1: Primacy of loss principle- resource loss is more salient than resource gain	<p><i>COR Application 1:</i> Principles 1 and 2 imply that people consider not only the potential magnitude of gains and losses from resource seeking, but also the likelihood (i.e., expectancy) of those gains and losses occurring. People are more likely to seek resources when they perceive that the magnitude and likelihood of potential gains from doing so will exceed the magnitude and likelihood of anticipated resource investment or cost.</p>
Principle 2: Resource investment principle—people must invest resources in order to gain resources, and also to protect themselves against and recover from resource loss	
Principle 3: Gain paradox principle—resource gains become more salient and are weighted more when people have experienced resource loss	<p><i>COR Application 2:</i> Principles 3 and 4 imply that the decision of whether to seek resources is not simply a rational utility calculus, but subjectivity and heuristic considerations play an important role. People's current resource status has a significant influence on how they subjectively assess potential gains and losses to maintain an optimal balance between resource conservation and acquisition.</p>
Principle 4: Desperation principle—resource deprivation drives people to become defensive, aggressive and even irrational when their resources are outstretched or exhausted	
<ul style="list-style-type: none"> <li>• A corollary of this principle is that primary resource loss, and the resource deprivation potentially caused by it, can generate secondary resource loss and even a spiral of increasing resource deprivation as individuals defensively adopt maladaptive strategies of resource conservation and recovery</li> </ul>	<p><i>COR Application 3:</i> Principle 4 implies a dynamic within-person perspective of resource seeking, with cycles and spirals of resource loss, as well as feedback loops between outcomes and resource seeking.</p>

---

**Notes:**  
 \*Some of the example cites in the table are meta-analyses or conceptual reviews, but most of the cites are stand-alone empirical papers.  
 (+) indicates positive influence on resource seeking, (-) indicates negative influence on resource seeking  
 FSB refers to feedback seeking behavior, ISB refers to information seeking behavior, ASB refers to advice seeking behavior, and HSB refers to help seeking behavior  
 Example cites are listed in this order: feedback seeking (FSB) literature, information seeking (ISB) literature, advice seeking (ASB) literature, help seeking (HSB) literature.

Table 4

## Outcomes of Resource Seeking\*

	Examined in all 4 literatures	Examined in 2 or 3 of the literatures	Examined in just 1 literature
<b>POSITIVE OUTCOMES</b>			
<b>Individual Level</b>	<p><b>Work performance (+)</b> 18 papers including: Anseel et al. (2015), Nifadkar &amp; Bauer (2016), Nadler et al. (2003), Lee &amp; Duffy, (2018) *2 papers did not find a relationship between resource seeking and performance: Anseel et al. (2015), Harrison et al. (2011)</p>	<p><b>Employee creativity (+)</b> 3 papers including: De Stobbeleir et al. (2011), Mueller &amp; Kamdar (2011)</p> <p><b>Turnover intentions (-)</b> 7 papers including: Dahling et al (2017), Bauer et al. <b>Team Level</b>	-	-	<b>Team performance (-)</b> 1 paper from HSB literature: Bamberger & Levi (2009)
<b>Organizational Level</b>	-	-	-

---

**Notes:**  
 (+) indicates resource seeking's positive influence on outcome, (-) indicates resource seeking's negative influence on outcome.  
 \*Some of the example cites in the table are meta-analyses or conceptual reviews, but most of the cites are stand-alone empirical papers.  
 \*\*Empirical studies in each of the four literatures examined unique set(s) of workplace and job attitudes but we grouped these findings under one broad category  
 Example cites are listed in this order: feedback seeking (FSB) literature, information seeking (ISB) literature, advice seeking (ASB) literature, help seeking (HSB) literature.

### Appendix: Search Procedure to Identify Articles for Inclusion in Review

To identify articles for inclusion in our review, we first identified the relevant search terms, which were help seeking, advice seeking, feedback seeking, and information seeking. Next, we identified a set of 150 journals by including all FT-50 journals and the top 50 journals in the business and management categories in the Journal Citation Reports (JCR, 2016). Given that a substantial number of articles on resource seeking are published in social and applied psychology journals, we also identified and included the top 20 social psychology and I/O psychology journals using JCR (2016). We conducted an initial exploratory search on the EBSCOhost database and eliminated journals that would be very unlikely to include studies of *employee* resource seeking (e.g., American Economic Review, Journal of Consumer Research). This left us with the 70 journals presented in the list at the end of this Appendix. After identifying this set of 70 journals, we searched EBSCOhost database in the period between 1997 and 2019 using the same relevant search terms in titles, abstracts, keyword or subject terms. Based on the search results, we identified 269 relevant articles. We also included in our review some foundational conceptual and empirical articles published in the prior two decades from 1977 to 1996, where these articles were amongst the first articles to be published in the respective areas of help seeking, advice seeking, feedback seeking, or information seeking and were highly cited. In our review, we focus on effects with substantial empirical support. As such, we do not cite or discuss all 269 articles.
